4.1 INTRODUCTION

Our region continues to grow and change

The greater Portland region is an extraordinary place to call home. It is known for its unique communities, a diverse and growing economy and a world-class transportation system. The region is surrounded by stunning natural landscapes and crisscrossed with a network of parks, trails and natural areas within a walk, bike ride or transit stop from home.

Part of the broader Pacific Northwest region, the Portland-Vancouver metropolitan area is one of four international gateways on the West Coast. In this role, the region serves as a freight gateway to domestic and international markets for businesses located throughout the state of Oregon, Southwest Washington, the Mountain states and the Midwest.

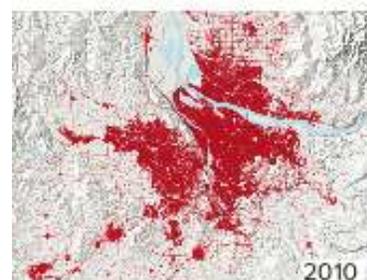

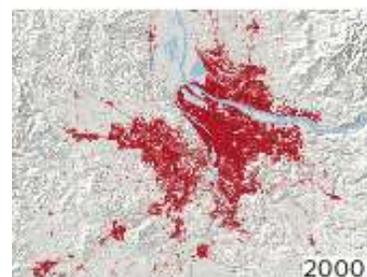

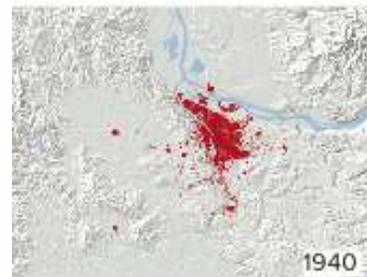

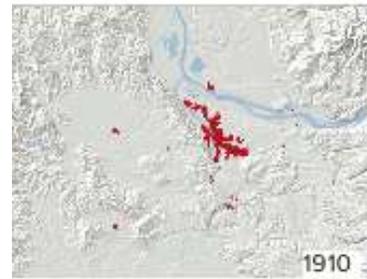

Over the years, communities throughout the region have taken a collaborative approach to planning that has helped make the region one of the most livable in the country.

Every day, the region's 2.4 million people have places to go – to work or school, to doctors and grocery stores and parks and back home again. All these trips, along with our transportation system, knit the region together – from Forest Grove to Troutdale, Vancouver and Portland to Wilsonville and every community in between.

Because of our dedication to planning and working together to make local and regional plans a reality, we have set a wise course for managing growth – but times are challenging. The region is growing, our economy is expanding, and emerging technologies are changing how we do business and get around.

Housing affordability, climate change, racial disparities, traffic deaths and life changing injuries, and traffic congestion demand new kinds of leadership, innovation and thoughtful deliberation and action to ensure our region remains a great place to live, work and play for everyone. In collaboration with city, county, state, business and

Land development, 1910-2010

community leaders, Metro has researched how land use and transportation policies and investments can be leveraged to respond to these complex and interrelated challenges at a regional scale.

This chapter provides a snapshot of current conditions, how our region is growing and changing and the challenges and opportunities that lay ahead.

The region expects to welcome more than 500,000 new residents – about half from growing families – and more than 350,000 new jobs within the urban growth boundary by 2040.

4.1.1 Chapter organization

This chapter provides a snapshot of current regional growth trends and existing conditions and outlines key transportation challenges the plan will address. The chapter also highlights opportunities for building a regional transportation system that reflects our values and vision for the future.

4.1 Introduction: This section introduces the chapter.

4.2 Who We Are: This section provides an overview of population growth; demographic changes for race, ethnicity and age; where people live and work; employment growth and jobs.

4.3 How We Get Around: This section provides a snapshot of how people in the region get around – driving, transit, walking and bicycling.

4.4 How We Move Goods and Services: This section provides an overview of how goods and services move in the region and how the region is competing in a global economy,

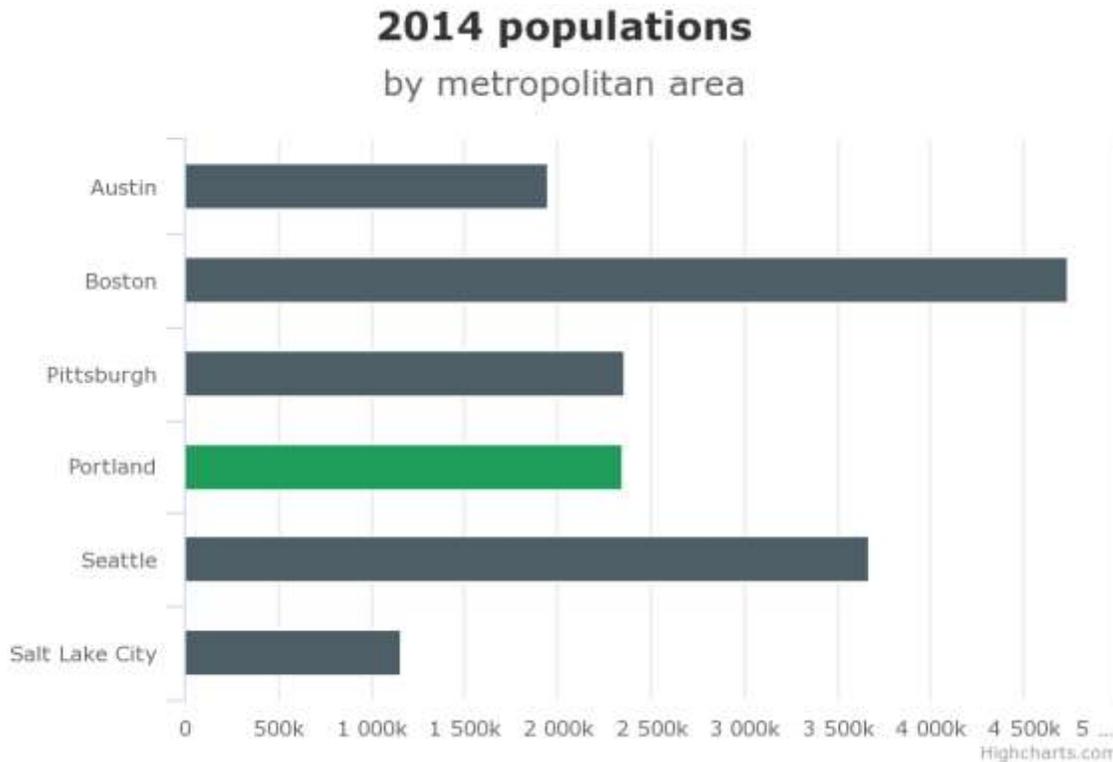

4.5 How We Keep Our Environment Healthy: This section describes current efforts and strategies to protect historic and cultural resources and keep the air, water and habitat in the greater Portland region healthy.

4.6 How the System Is Working – Challenges and Opportunities Ahead: This section describes the major challenges the region is facing and the opportunities that each challenge presents to achieve the region’s vision for funding the transportation we need; updating and maintaining aging infrastructure; addressing climate change and air quality; addressing congestion and reliability; eliminating fatal and life-changing motor-vehicle crashes; addressing earthquake vulnerability, security and emergency services; filling gaps in transit, biking and walking connections; addressing housing and transportation affordability and displacement; addressing social inequity and disparities; and proactively addressing technological change.

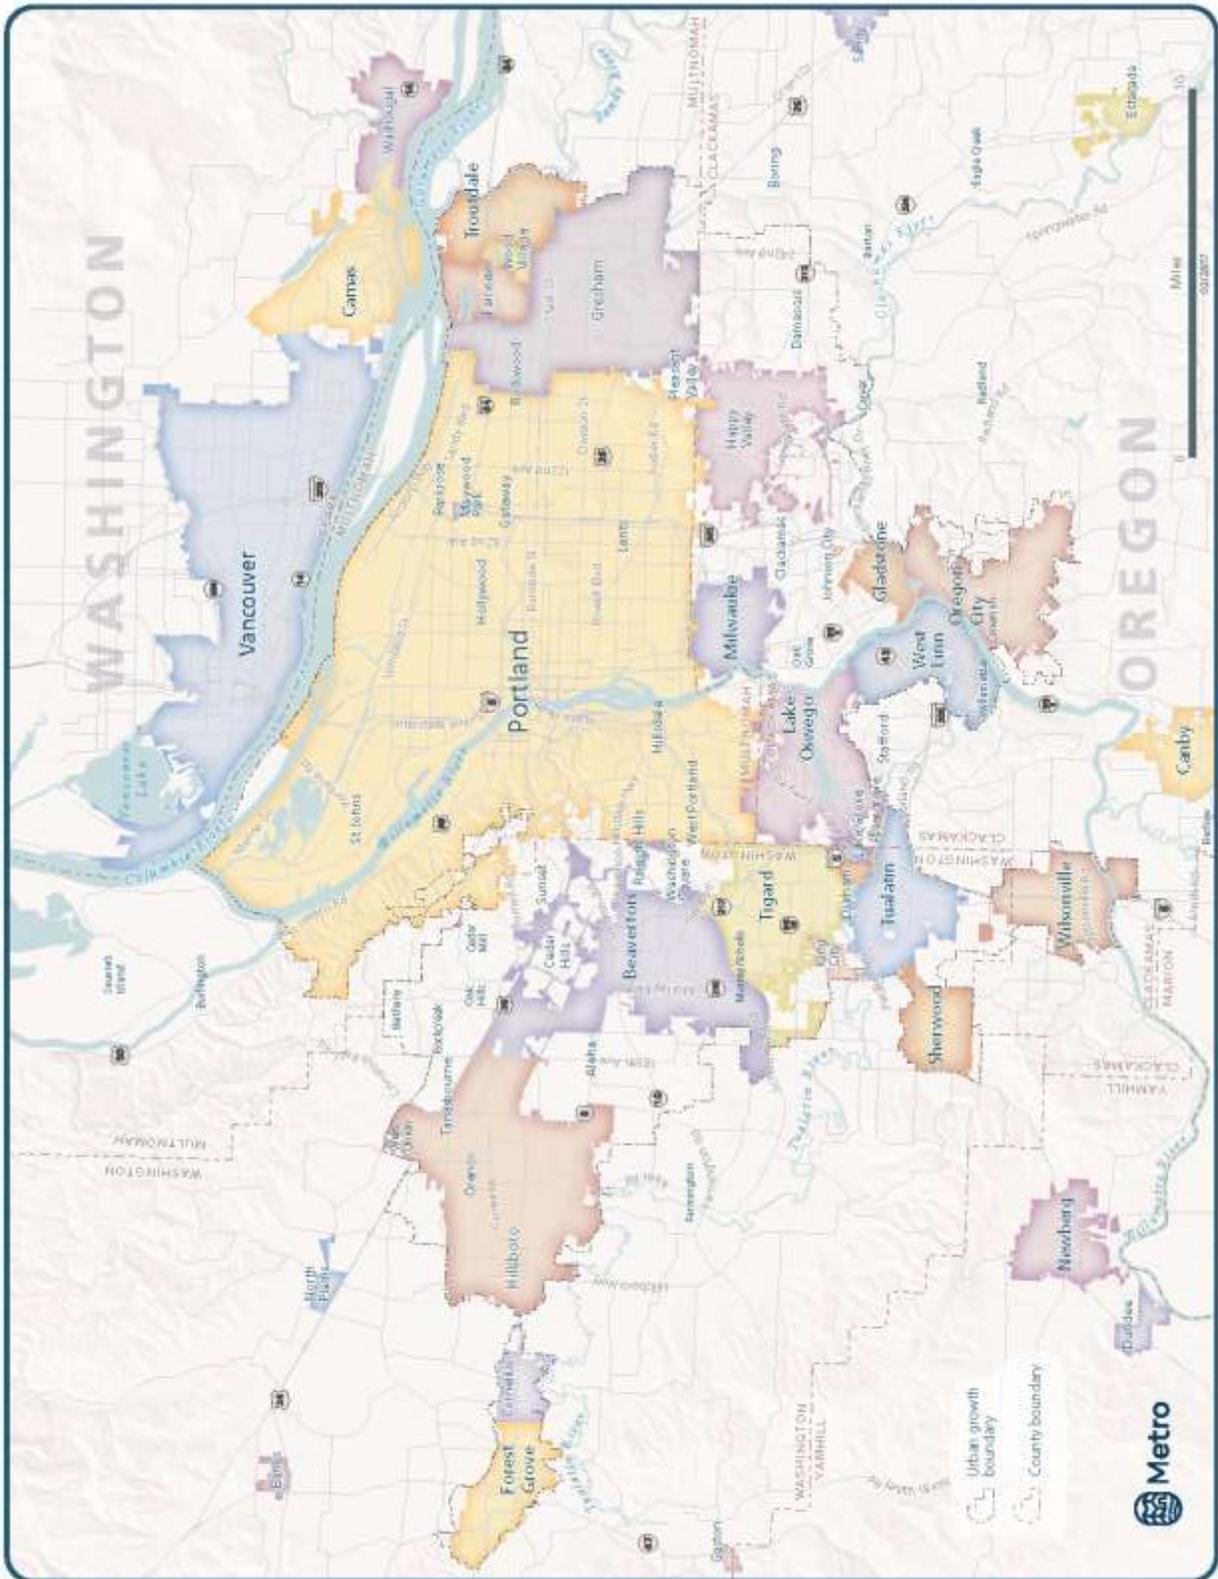

4.2 WHO WE ARE

The Portland metropolitan region is growing and changing, shaped by a global economy, a warming planet, demographic changes, public health and safety concerns and changes in how we live and travel. By population, Portland is the 24th largest metropolitan area in the country. The region has about half as many people as Boston and twice as many people as Salt Lake City. The greater Pittsburgh and San Antonio regions are about the same size.

Figure 4.1 Population by metropolitan area, 2014

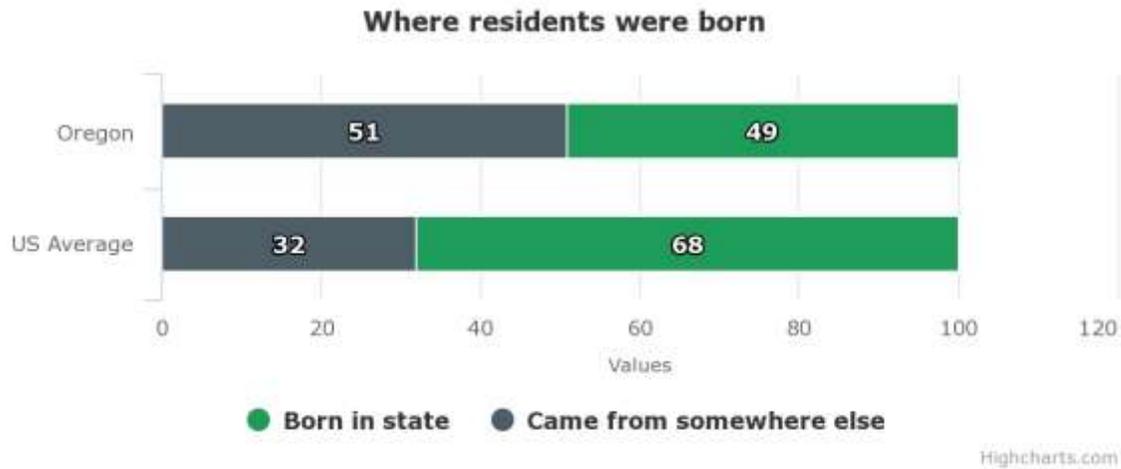

The Oregon portion of the Portland-Vancouver metropolitan region encompasses 24 cities and 3 counties as shown on the next page. Metro's urban growth boundary includes 403 square miles and more than 1.5 million residents.

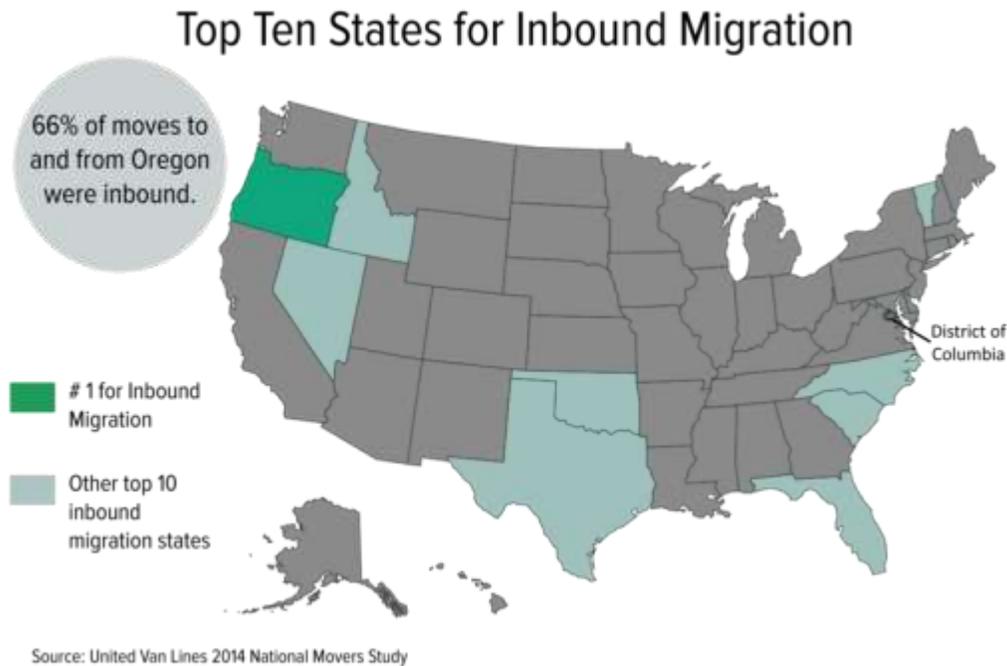

Our region continues to grow. New forecasts show that between 2015 and 2035, about 400,000 additional people are expected to live within the Metro region’s urban growth boundary.¹ But how much are we growing, and how fast? And where are these new people coming from? In short, many are coming from somewhere else in the country, and it's adding up. Nationally, 68 percent of Americans live in the state where they were born, however in Oregon 51 percent of population came from somewhere else.

Figure 4.2 Percent of population by location of birth

Oregon is the number one state for inbound migration for the second year in a row.

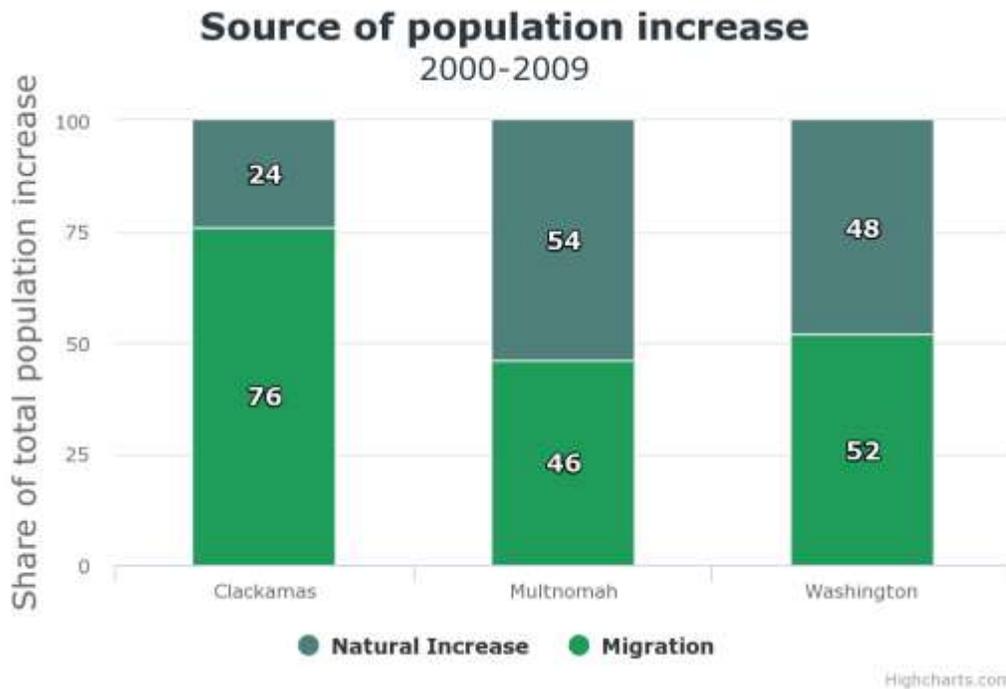

Figure 4.3 Top ten states for inbound migration

¹ 2014 Urban Growth Report, Metro, December 2015

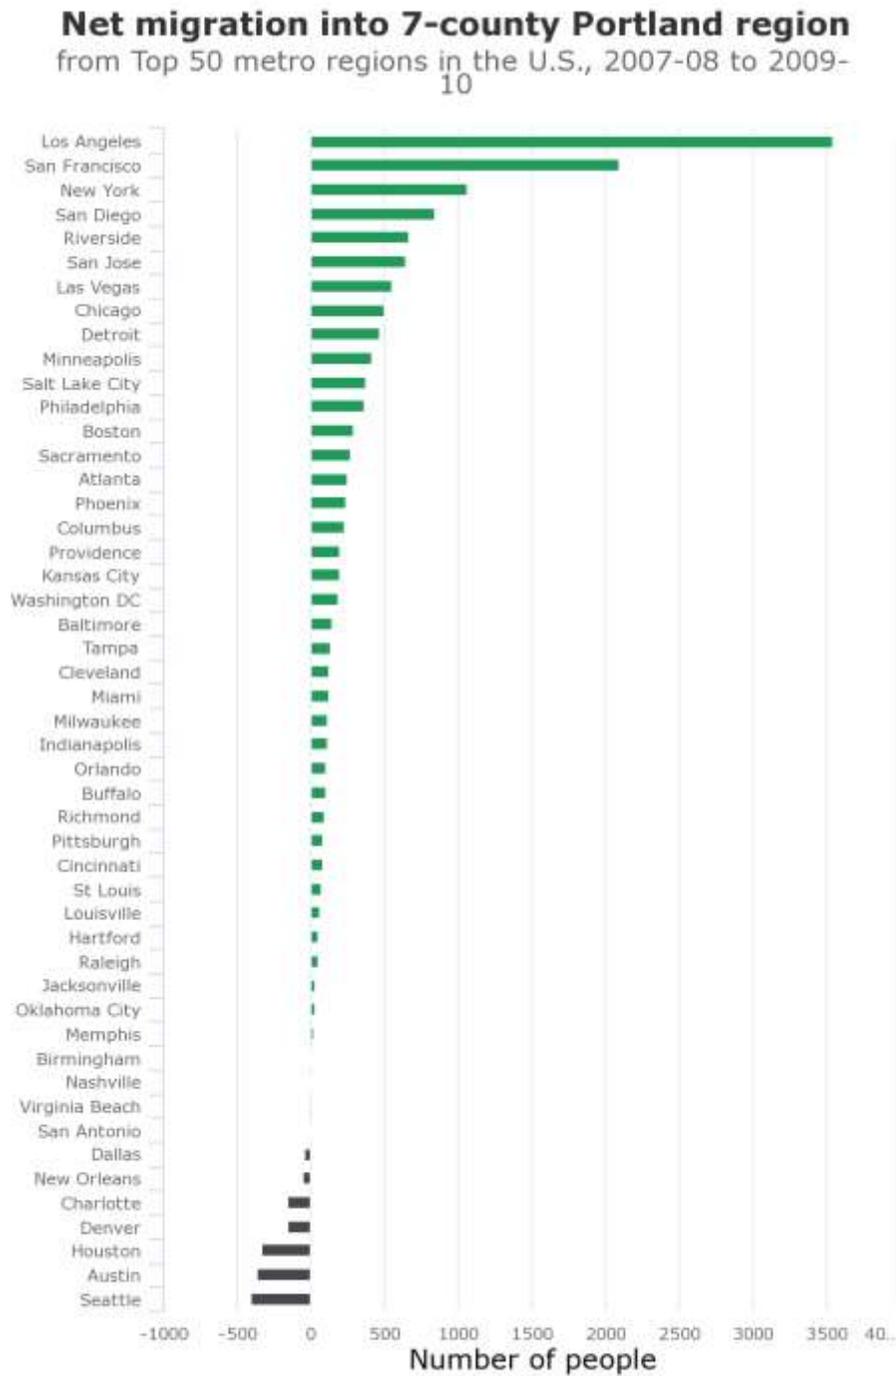

But different parts of the region are experiencing different sources of growth. For instance, between 2000 and 2009, Clackamas and Washington counties primarily grew due to people moving from other counties around the country. Most of Multnomah County’s growth in that period was the result of natural increase – in other words, more people being born than dying in the county, as shown in **Figure 4.4** below.

Figure 4.4 Source of population increase in the three counties, 2000-2009

Most of the people are coming from California. From 2007-08 to 2009-10, four of the top five cities contributing to the Portland region's growth were Californian. (New York City was the only non-Californian city in the top five.) On the other hand, the region is losing people to Seattle, Austin and Houston.

Figure 4.5 Net migration into the 7-county Portland region

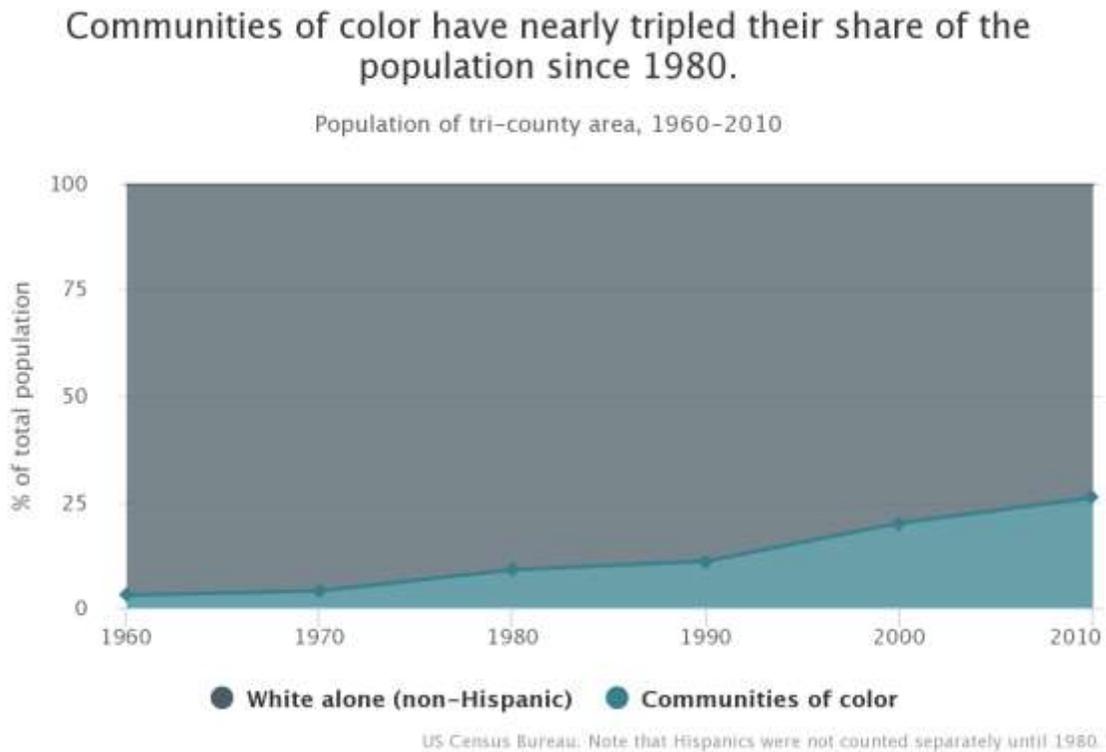

While this growth brings jobs and opportunity, it also creates new challenges; more people will be using the region’s transportation system to get to work, school, shopping and other daily activities. According to the 2011 Oregon Household Activity Survey, the average household in the Portland region makes 9.2 trips per day with an average trip length of 4.4 miles for trips taken by car.

4.2.1 Demographic changes

Our population and communities continue to change. While the greater Portland region historically has had less racial diversity than other American cities, the region increasingly reflects the diversity of the country. However, the specific historic and systemic exclusion of and bias against African Americans is still reflected in the makeup of our population. In 2010, the population of greater Portland was 71 percent White compared to 64 percent nationally, and 4 percent African American compared to 12 percent nationally.

Also of note is the difference in Hispanic/Latinx population (10 percent for the region, 16 percent nationally) and those whose racial/ethnic identity is not easily categorized by the U.S. Census categories (those grouped as “other”: 6 percent for the region, 2 percent nationally). Communities of color are growing in their share of the Portland region's population, and they are less concentrated in Multnomah County than they once were.

Figure 4.6 Communities of color share of population since 1980

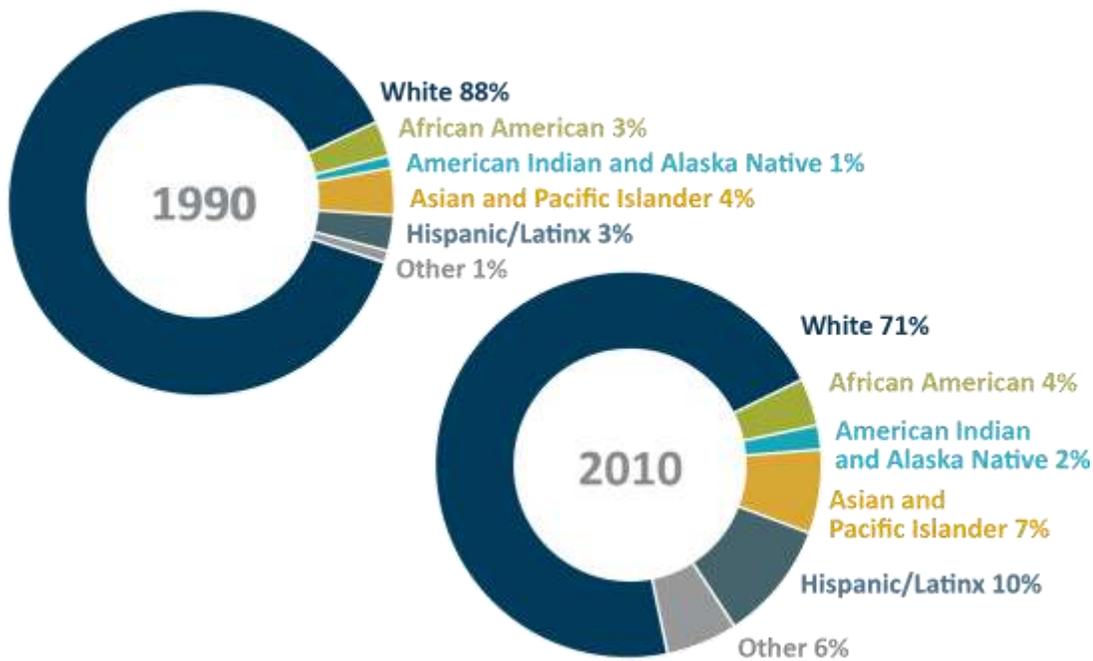

In 1960, Clackamas and Washington counties had a combined population of 205,275. According to that year's Census, 153 of them were black and 965 were neither white nor black. In Multnomah County, about 16,000 people of the county's total population of 523,000 people were black – the vast majority of the state's 18,000 black residents. By 2010, Multnomah County had 530,000 white, non-Hispanic residents – about 72 percent of its total population of 735,334 residents. The black population had grown to

41,000 residents, still the majority of Oregon's 69,000 black residents but not the overwhelming majority it was four decades earlier.

In 2010, about 220,000 residents of Clackamas and Washington counties identified as Hispanic or a race other than white – about a quarter of their total population. In 1980, the first year the Census reliably tracked Hispanic population figures; there were about 21,000 Hispanics in greater Portland – about 2 percent of the tri-county population. By 2014, that number was estimated to be 202,000 – close to 12 percent. Overall, communities of color saw their share of greater Portland's population rise from barely 3 percent in 1960 to almost 26 percent in 2010.

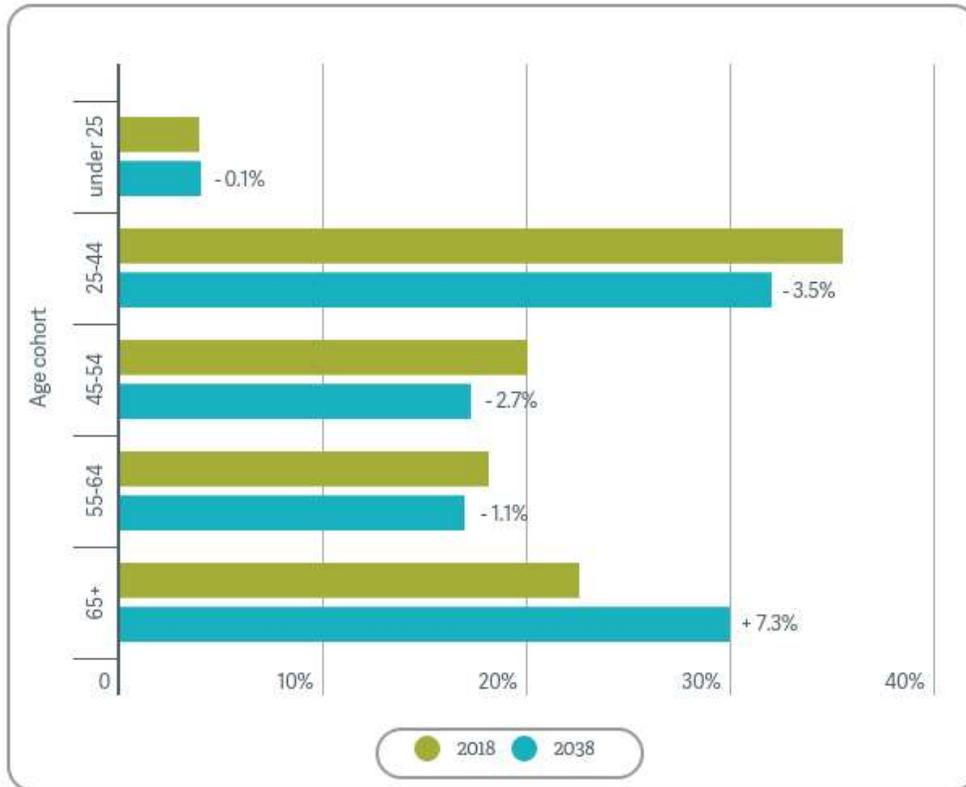

Figure 4.7 Race and ethnicity in the greater Portland region

Source: 1990 and 2010 US census

Figure 4.8 Age cohorts as a percentage of total population

Age cohorts as a percentage of total population 7-county Portland-Vancouver-Hillsboro MSA, 2018 and 2038

Source: 2018-38 Portland-Vancouver-Hillsboro, OR-WA MSA Forecast, Metro Research Center, November 2017

In the greater metropolitan statistical area (MSA) which includes the greater Portland area, there will be a significant growth in the older adult (65+ years) population between 2018 and 2038 of over 7 percent, compared to a reduction for other age groups.

The changing demographics of the region for age follow a national trend of aging – the percent of the population over 65 continues to increase. Today, 12 percent of Americans are over the age of 65. By 2030, 20 percent of the United States’ population will be older than 65.

Public health is a growing concern

Interest in the connection between urban planning and active living has continued to grow since the 1990s, an outcome of a growing interest in “smart growth,” a movement to integrate land use, transportation and public health planning. Studies since then report positive effects on human health in neighborhoods built to encourage walking and biking. In addition, transportation systems impact chronic diseases such as asthma that are

related to air quality and vehicle emissions. These health impacts affect people of color disproportionately. The greater Portland region has long embraced such policies, based on land use and transportation benefits, and the introduction of health goals and objectives in transportation planning supports efforts to positively impact public health with transportation design.

Figure 4.9 Prevalence of self-reported obesity among U.S. adults by state and territory, BRFSS, 2011

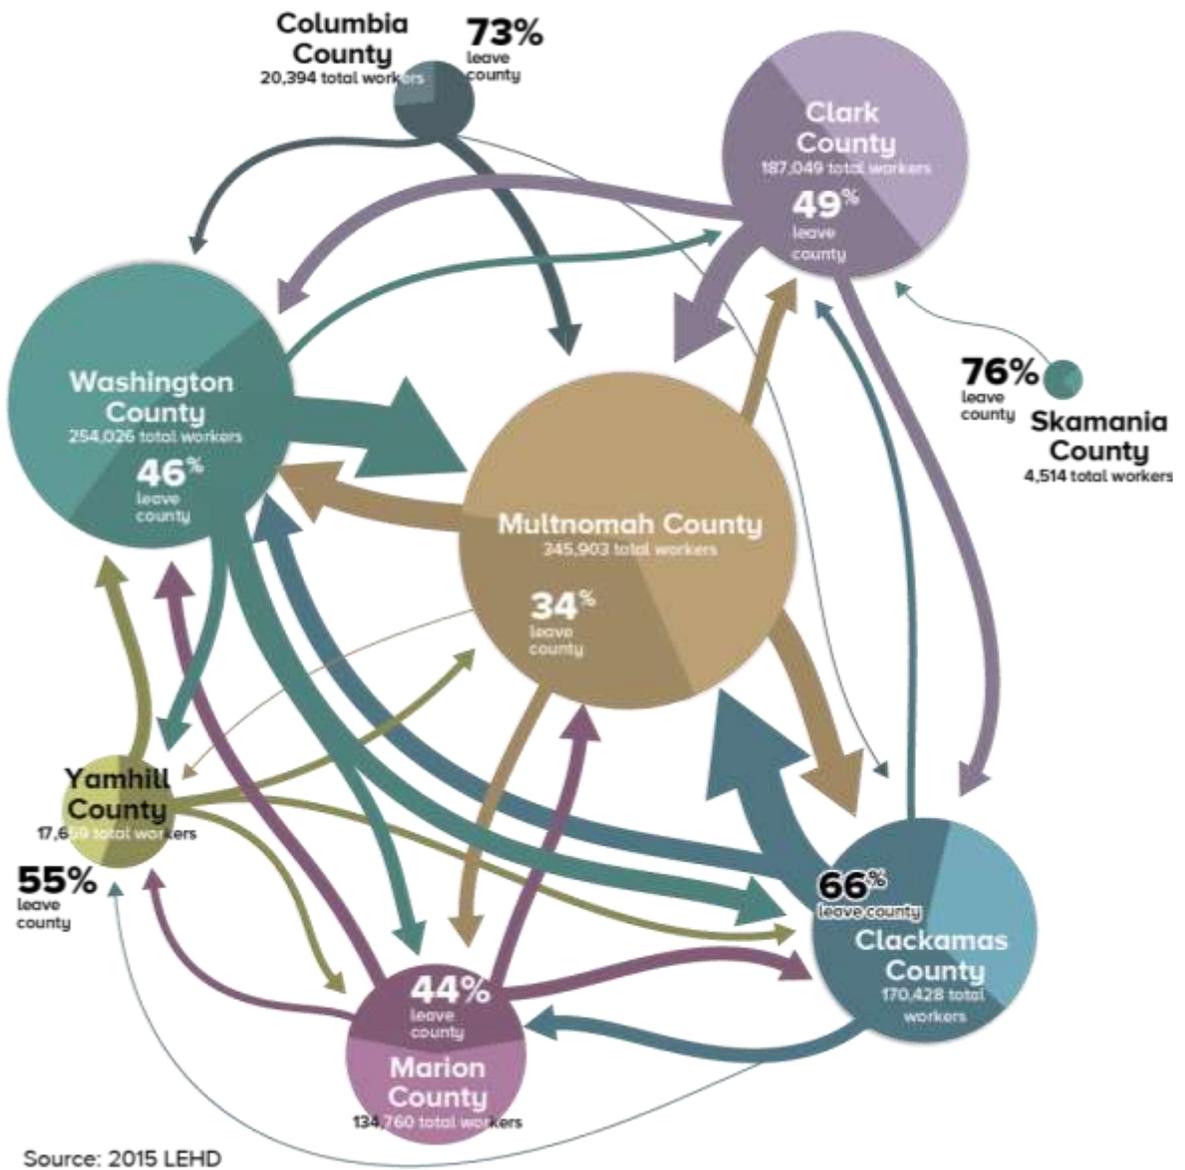

Figure 4.10 Prevalence of self-reported obesity among U.S. adults by state and territory, BRFSS, 2016

4.2.2 Where we live and work

There are differences in where each of us goes every day, providing insight into the region's distribution of housing and jobs. Take the flow of the daily commute, for example. Multnomah County has the most working residents and the most jobs. According to data from the Census Bureau, two-thirds of working residents in Multnomah County stay in their home county for work. Of those who leave, most head into Washington County, the region's second biggest job center.

Figure 4.11 Where residents work in the greater Portland region

For working residents of Clark and Washington counties, it's roughly an even split between working in the county and leaving, with most workers who leave commuting into Multnomah County. Clackamas County sees two-thirds of its working residents commute elsewhere, also mostly to Multnomah County. Washington and Clackamas counties also swap thousands of working residents each day – though not nearly as many commuters as each county send into Multnomah County.

Did you know?

Since the adoption of the 2040 Growth Concept, the majority of new homes have been added in downtowns and centers across the greater Portland region.

4.2.3 Jobs and a growing economy

The region's economy has been marked by job growth, shifts in job types, and growth in traded sector businesses. The greater Portland region employs over a million workers, the fifth largest workforce on the west coast². Prior to about 2011, the region had higher unemployment rates compared to the U.S. as a whole, but since the recovery, Portland's rates have been more in sync with the rest of the nation.

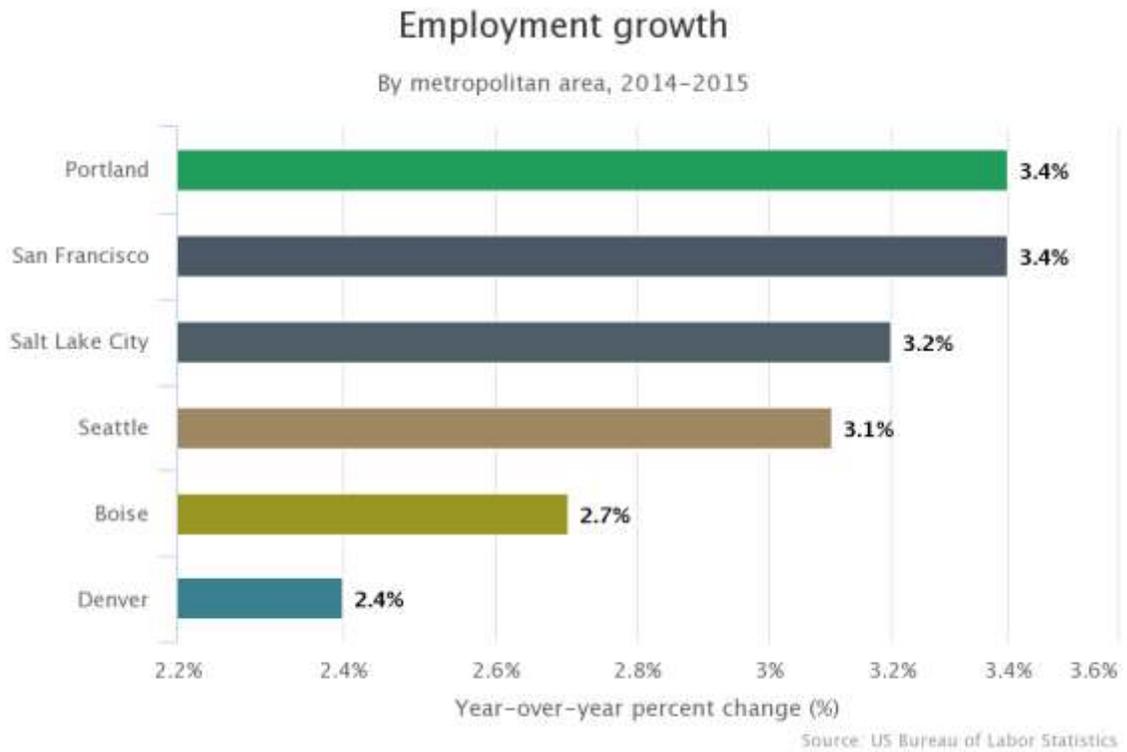

Figure 4.12 Unemployment rate in the greater Portland region

The region has regained twice as many jobs as it lost in the recession and job growth is up. The region is also attracting a young, highly educated workforce. Over the past year, Portland's growth has been strong – on par with San Francisco.

² [Greater Portland Work Book, 2013-14](#)

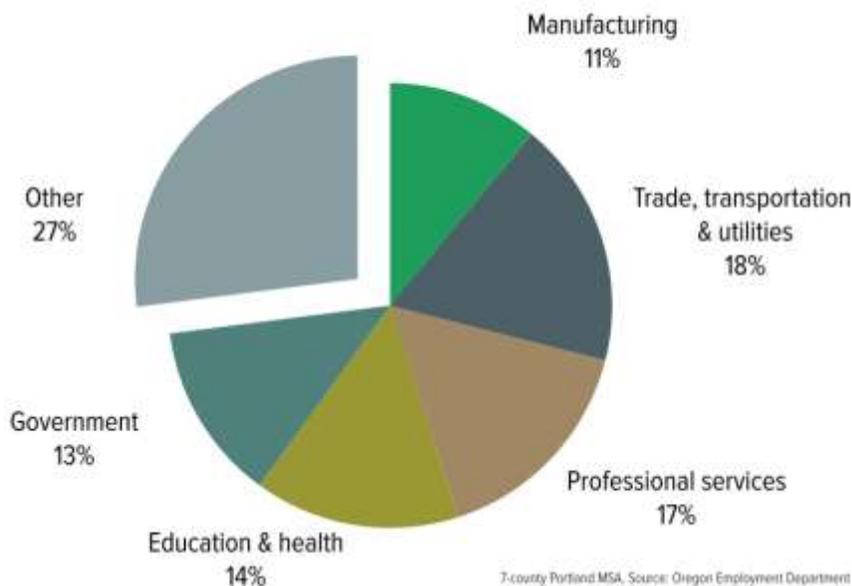

Figure 4.13 Employment growth

Currently almost half of Portland area residents work in trade and transportation, professional services, and education and health.

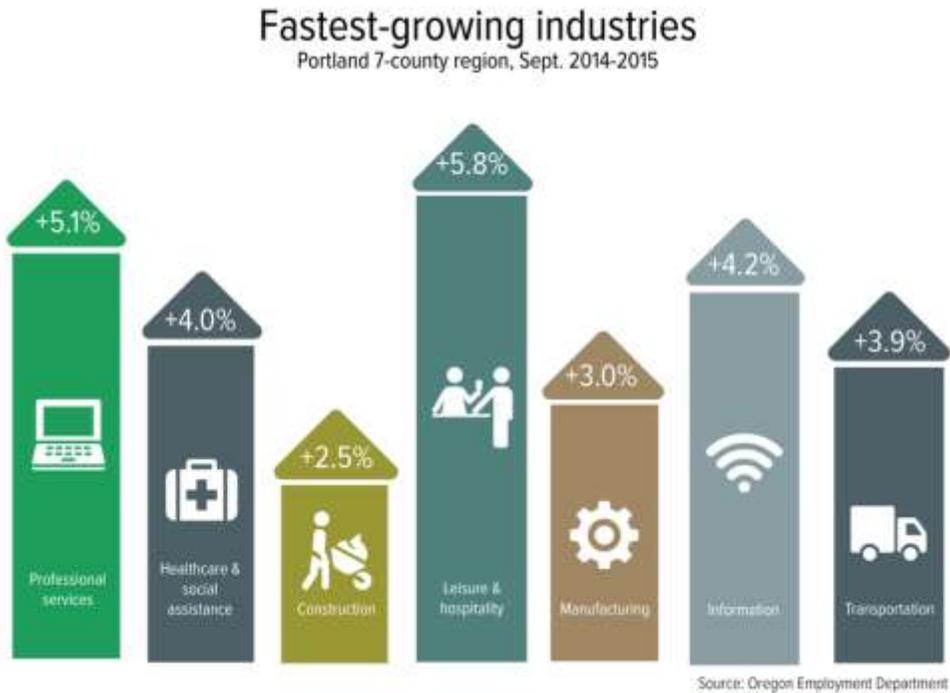

Figure 4.14 Employment mix in the 7-county MSA, 2015

Current employment mix

Several job sectors are doing exceptionally well in the Portland region, particularly professional and business services and leisure and hospitality. These sectors have been adding workers more quickly than other sectors as the region comes out of the recession.

Figure 4.15 Fastest growing industries

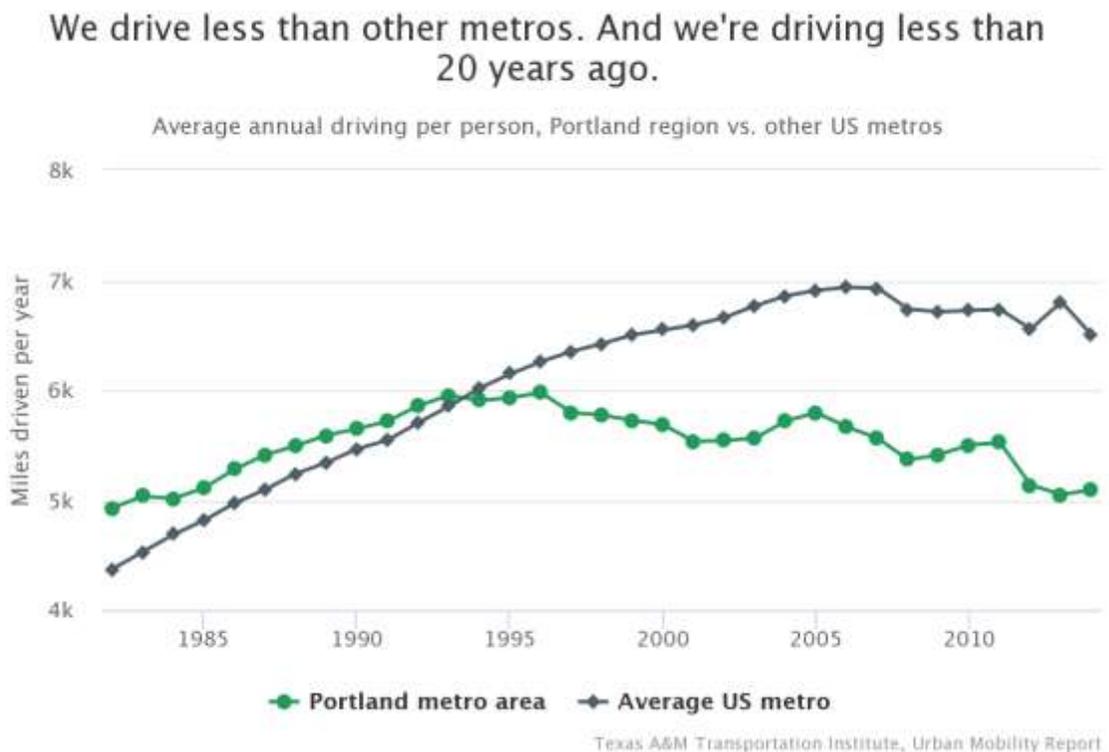

4.4 HOW WE GET AROUND

4.4.1 Travel

Travel behavior—mode choice, commuting patterns, trip length and frequency—is influenced by a number of factors, including demographics, land use, community design, cost, access, the economy, job locations as well as social and environmental values. On a per-person basis, the Portland region has been driving less since 1996, even as people take about the same number of trips each day. According to the 2015 Texas A&M Transportation Institute’s Urban Mobility Report, the region’s residents drove just 5,000 miles per person in 2014 – that’s nearly 25 percent less than other US metro regions of similar size.

Figure 4.16 Average annual driving per person, greater Portland region compared to other metropolitan areas

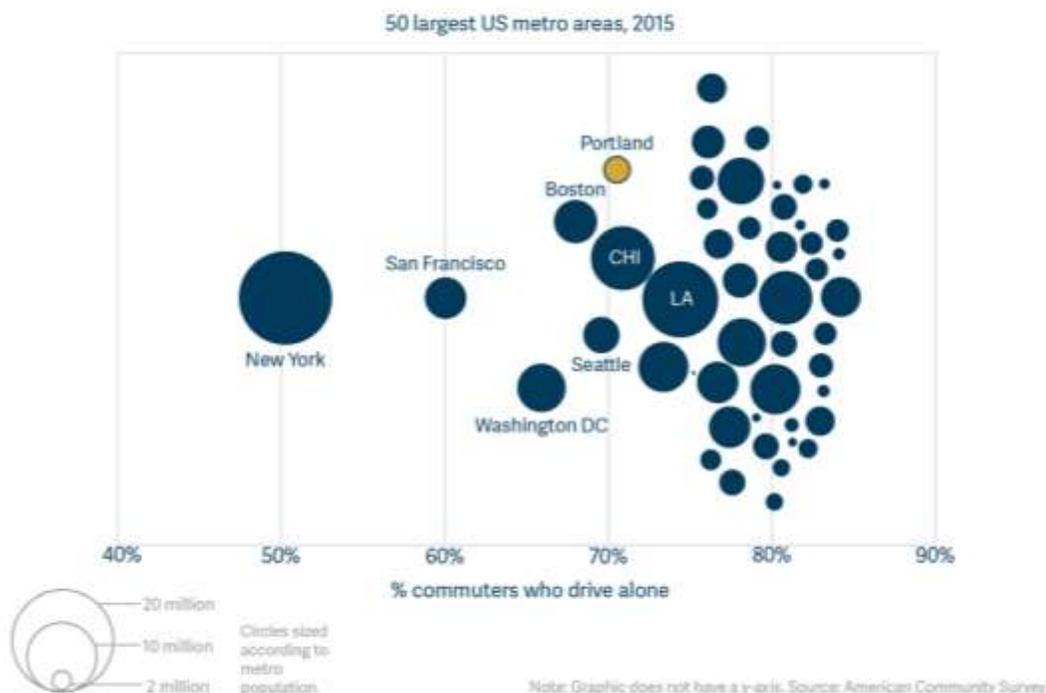

Why are people driving less here? Part of the reason is that people in the Portland region are making different choices about getting around – a reflection of the multimodal options available as defined in the 2040 Growth Concept. US Census estimates from 2014 show that while the national average for drive-alone commuting is 76.4 percent, the Portland metro area’s average was just 70.7 percent, resulting in associated reductions in greenhouse gas emissions for the region.

Though a growing population invariably means more commuters, just under half of the workers added since 2000 drive to work alone. The majority are choosing other modes, or working from home.

Figure 4.17 Ranking of drive alone commuting in metropolitan areas

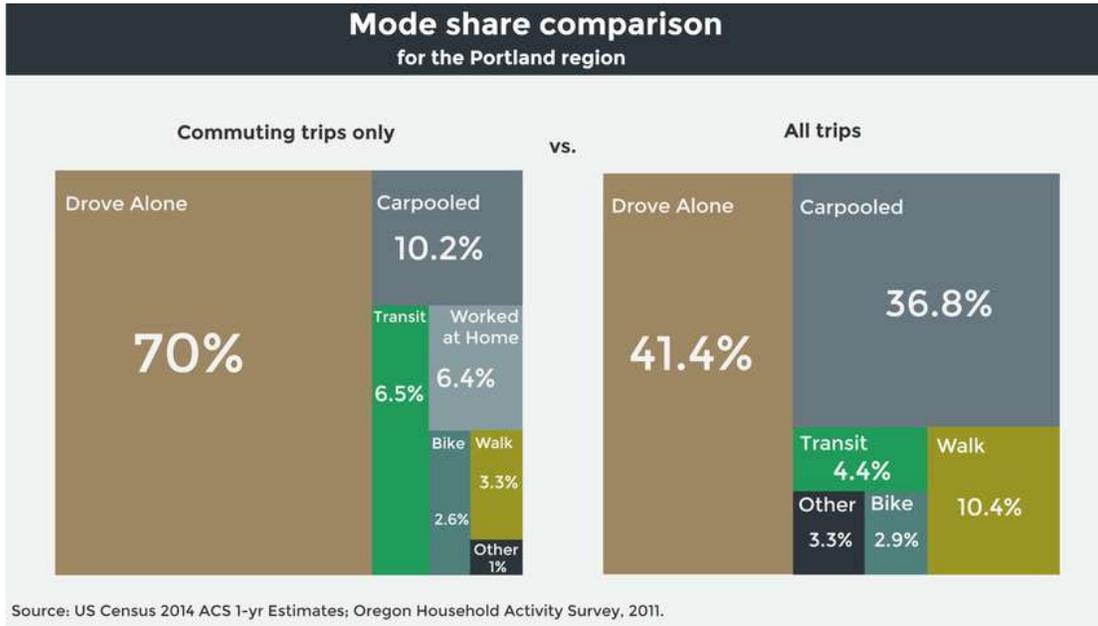

Greater Portland has the 6th-lowest rate of drive-alone commuting.

4.4.2 Mode share

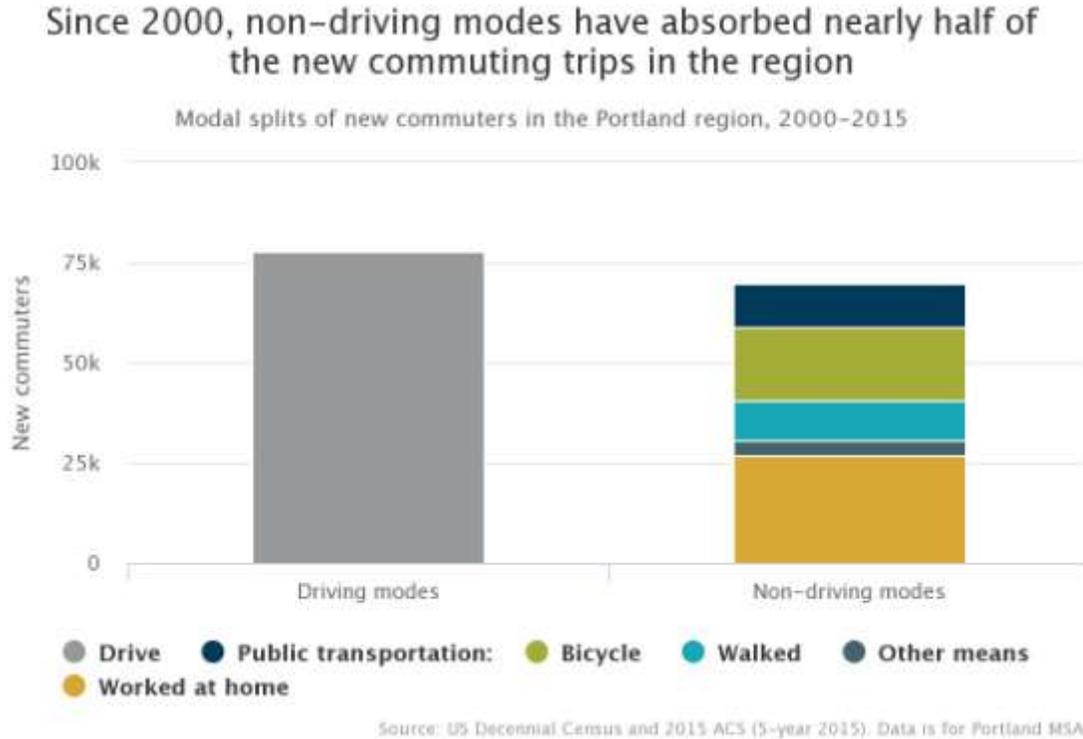

Travel to work has typically been the focus of transportation planning, especially given its prominence in the morning and evening peak periods. However these trips make up a relatively small portion of all the trips taken throughout the region. Nationwide travel for non-work purposes, such as shopping, errands and recreation is growing faster than work travel. In fact, more than 70 percent of the trips taken in the Portland region are for reasons other than school and work.

Figure 4.18 Mode share comparison for commute and all trips

Though a growing population invariably means more commuters, just under half of the workers added since 2000 drive to work alone. The majority are choosing other modes, or working from home.

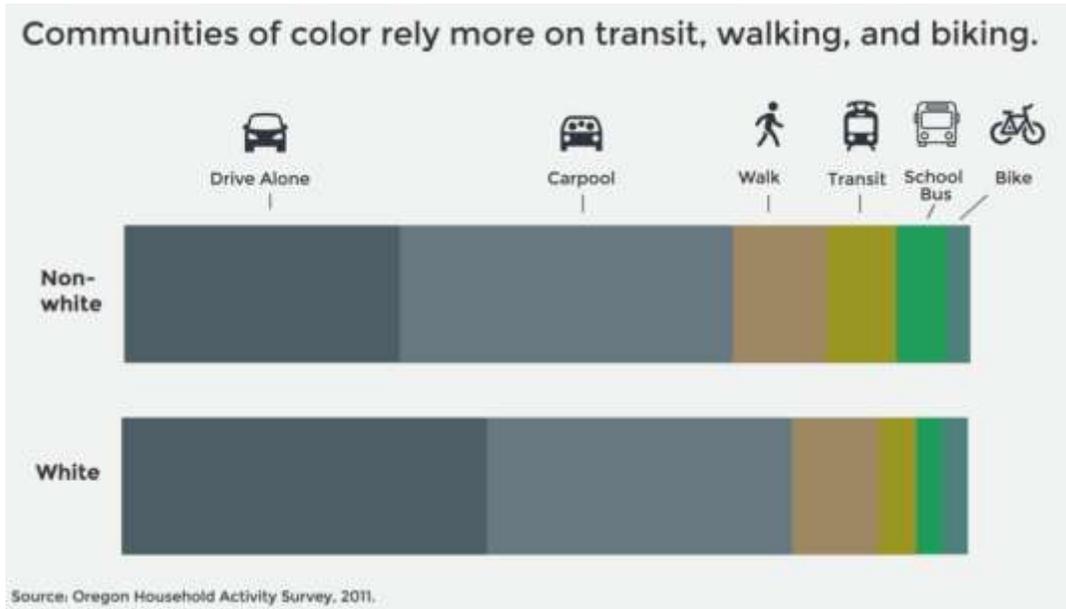

Figure 4.19 Mode share of new commuters in the 7-county MSA, 2000-2015

In 2003, Metro’s Regional Travel Options (RTO) program started to target non-commute trips during rush hour and throughout the day as a key strategy for addressing congestion and air quality issues in the region.

Driving is the most predominant way for people in the region to get around. In 2015, more than 80 percent of all trips in the greater Portland region were made by motor vehicle. Communities of color drive less than White residents in the region.

Figure 4.20 Travel modes by white and non-white populations, 2011

Driving remains the most expensive form of transportation, both for individuals and for society. The average annual cost of owning an automobile is over \$8,000 a year. However, fuel is comparatively cheap, and driving remains a convenient and efficient way to travel in the region.

Figure 4.21 Annual transportation costs

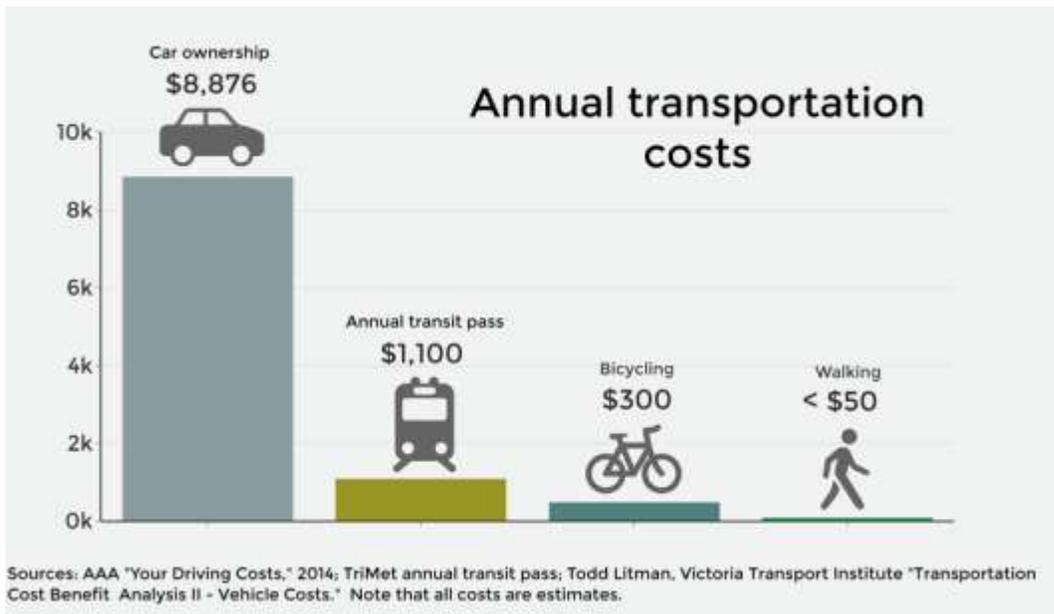

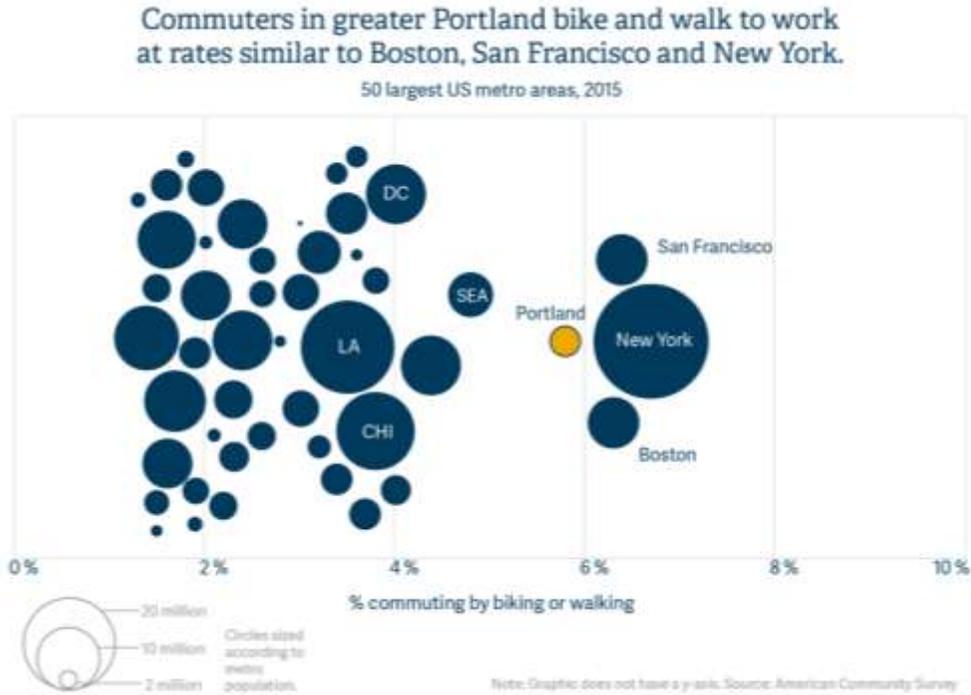

Figure 4.22 2016 TriMet cost per ride

Walking is the most primary form of transportation. Whether an entire trip is done on foot or using a wheelchair or similar mobility device, people must walk for at least a part of every trip, even when the rest of the trip takes place on transit, in a vehicle or on a bicycle. Pedestrian activity thrives where the pedestrian facilities are well connected, safe and attractive—meaning well lit, free of debris and in good repair—and frequent protected crossings. Therefore it is critical that our transportation system supports and encourages walking for short trips.

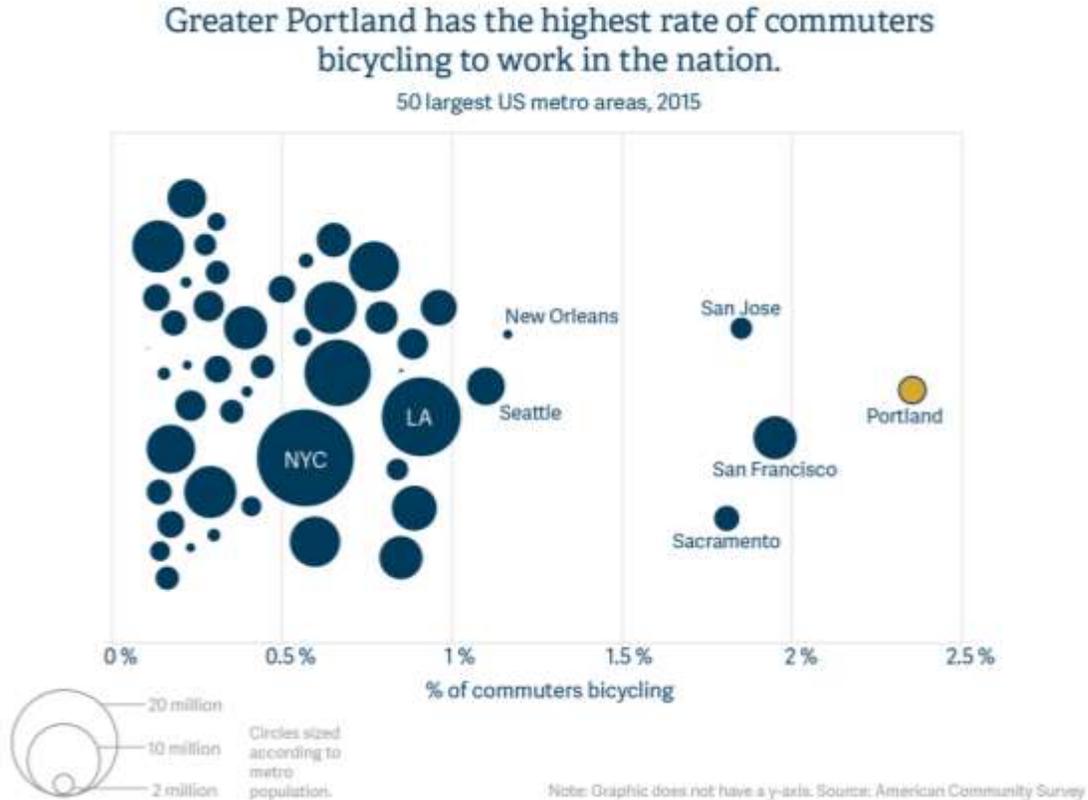

Figure 4.23 Bike and walk commute rates for metropolitan areas

Bicycling plays an important and growing role in the regional transportation system and the region's economy. Bicycling for transportation grew by 191 percent between 1994 and 2011 adding to the growing demand for improved bicycle facilities.³ Counts taken across five Portland city bridges reported 18,794 daily bicycle trips—a 128 percent increase over the previous 10 years. Increased ridership is due in part to improved bicycle infrastructure as well as increased recognition of the health benefits of bicycling.

³ 2011 Oregon Household Activity Survey, Metro.

Figure 4.24 Bike commute rates for metropolitan areas

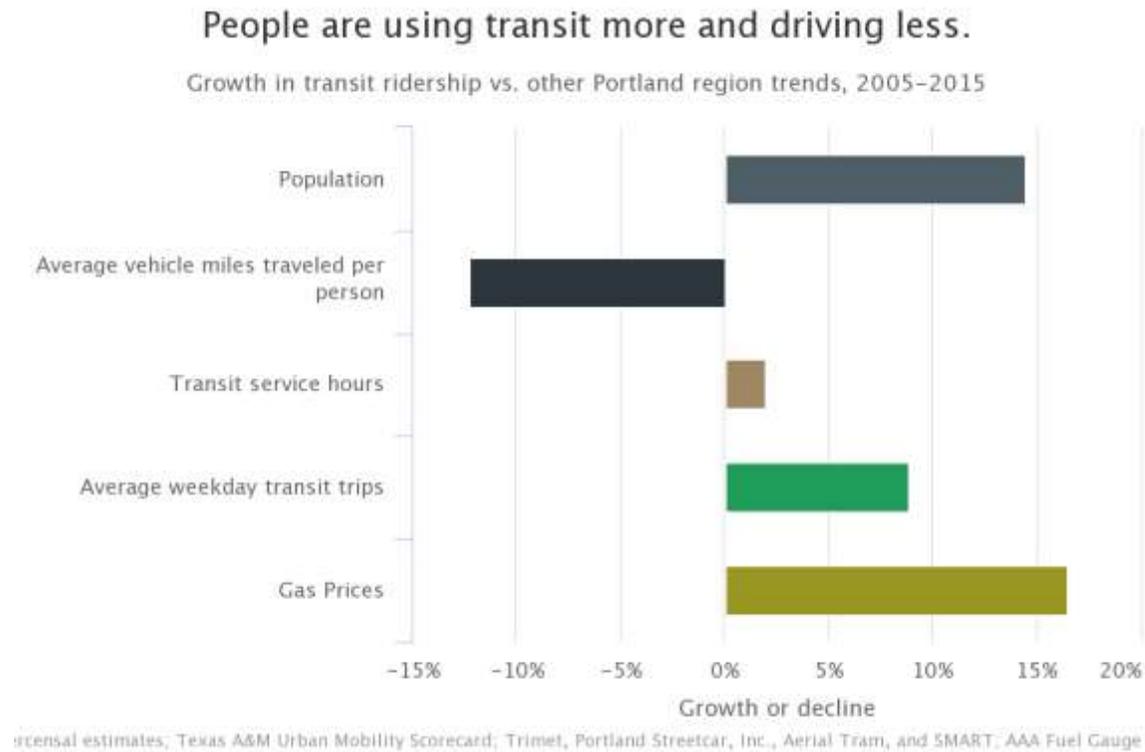

Transit - MAX Light rail, WES commuter rail, bus, and Portland Streetcar and supporting infrastructure make up the current regional transit system, which has seen increased ridership. In 2014, people in the Portland region took more than 103 million rides on transit. Although ridership has fluctuated over the last 10 years, weekday transit ridership among the region's major transit services – TriMet, SMART (Wilsonville), C-TRAN (Vancouver and Clark County WA) and Portland Streetcar – has grown while the average miles each person drives daily has declined.

Figure 4.25 Transit commute rates for metropolitan areas

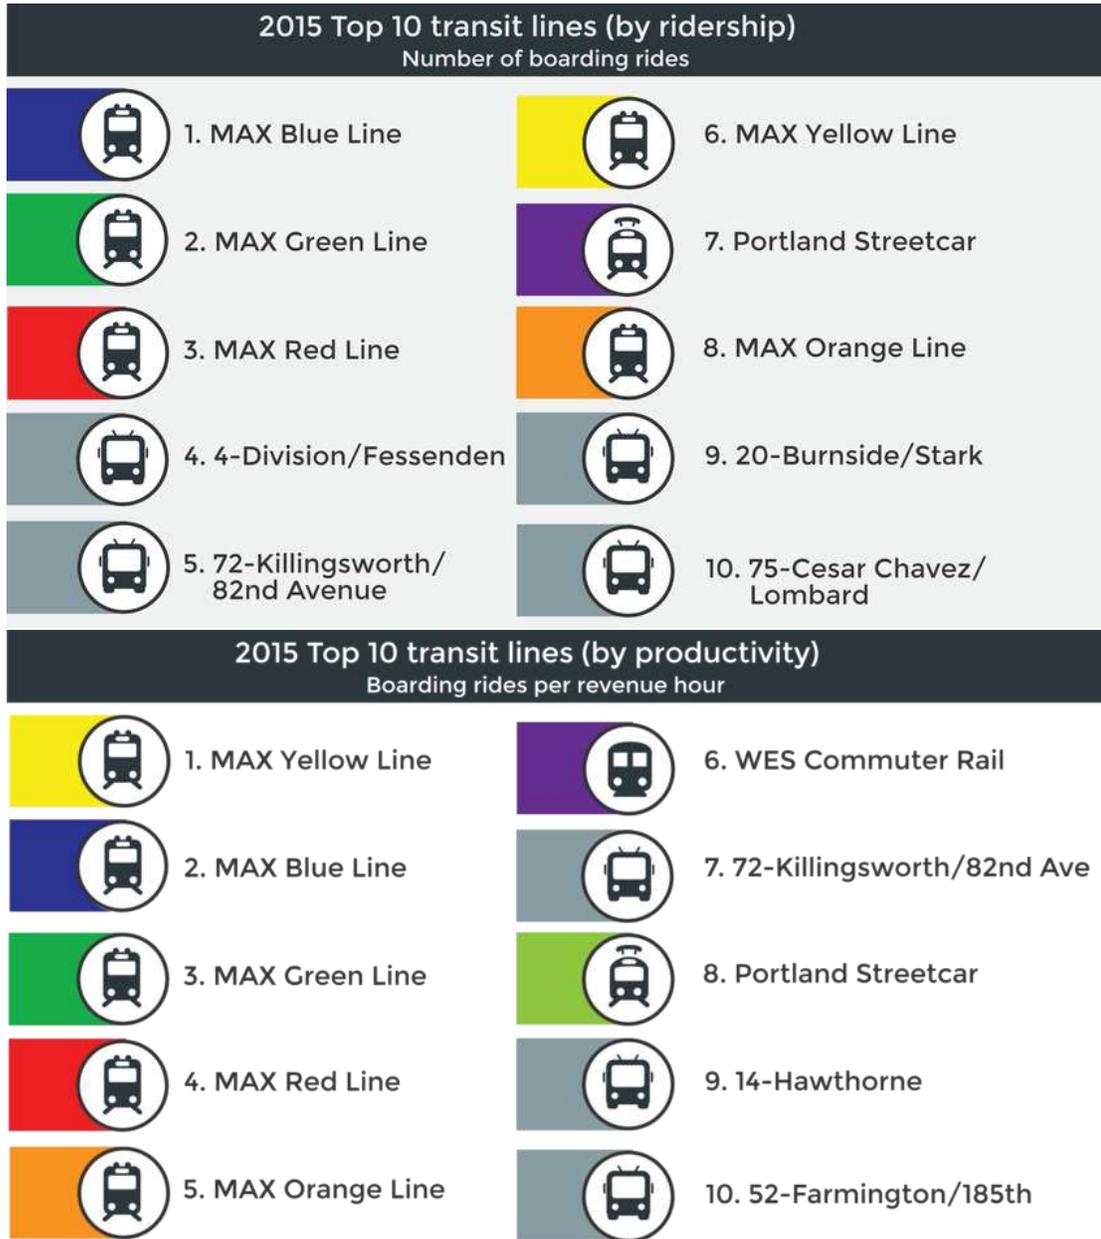

Figure 4.26 Mode share change 2005-2015

As can be seen in **Figure 4.27**, rail transit (light rail, commuter rail and streetcar) carries a big share of the region's transit passengers. For example, although the MAX network only has 88 total track miles compared to the bus network's 822 miles, MAX lines carry almost two-fifths of all transit trips. The Blue MAX line alone carries nearly 60,000 people per day.

Figure 4.27 Top Performing Transit Lines, 2015

Effectiveness of employer commuter programs and community and neighborhood programs on changing mode share

Between 1997 and 2006, the TriMet, Wilsonville SMART and transportation management association employer-outreach programs have made significant progress with reducing drive-alone trips. Since 1997, employee commute trips that used non- drive-alone modes (transit, bicycling, walking, carpooling/ vanpooling and telecommuting) rose from 20 percent to over 39 percent among participating employers.

Community outreach programs such as Portland Sunday Parkways and Wilsonville Sunday Streets encourage residents to use travel options by exploring their neighborhoods on foot and bike without competing with motorized traffic. Sunday Parkways events have attracted 119,000 participants, and the Wilsonville Sunday Streets event attracted more than 5,000 participants in 2012.

Other examples of valuable community outreach and educational programs include the Community Cycling Center's program to reduce barriers to biking and Metro's Vámonos program, both of which provide communities across the region with the skills and resources to become more active by walking, biking and using transit for their transportation needs.

In 2004, the City of Portland launched the Interstate TravelSmart individualized marketing project in conjunction with the opening of the MAX Yellow Line. Households that received individualized marketing made nearly twice as many transit trips compared to a similar group of households that did not participate in the marketing campaign. In addition, transit use increased nearly 15 percent during the SmartTrips project along the MAX Green Line in 2010. Follow-up surveys show that household travel behavior is sustained for at least two years after a project has been completed.

In 2015, a unique partnership between Metro, the City of Milwaukie and ODOT engaged residents along the last three stops of the new MAX Orange Line. More than 25 percent of residents participated in the program to learn about new travel options, resulting in a reduction of more than 1.3 million single occupant vehicle miles driven the year after the opening of the line.

Quick facts: Commuting in the Portland region

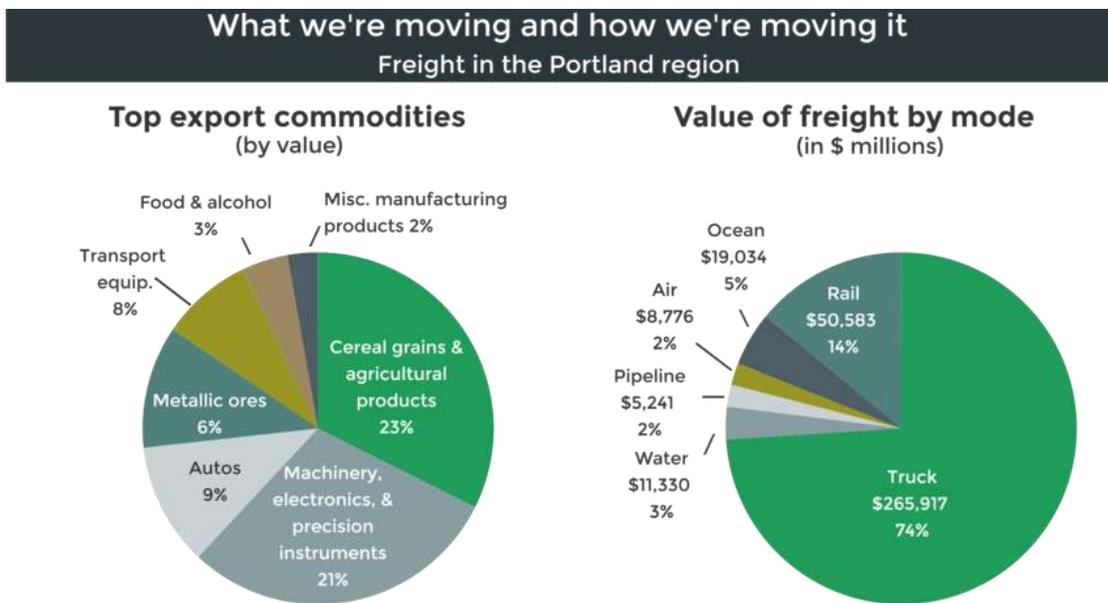

-  If we drove at the same levels we did in 2000, there'd be 34,000 more drive-alone commuters on the roads each day.
- 78% of TriMet riders are "choice" riders - they own a car but opt to use transit. 
-  Enough people bike to work each day to nearly fill Providence Park stadium.
- Working from home has taken more cars off the road than any other mode since 2000. 

4.5 HOW WE MOVE GOODS AND SERVICES

Despite a growing “buy local” movement, most of the products we buy come from someplace else and many of the goods we produce in Oregon move on to markets in other states and countries. In comparison with other U.S. metropolitan areas of similar size, Portland’s competitiveness is largely dependent on the region’s goal as a gateway and distribution center for domestic inland and international markets⁴. The global economy is expanding rapidly, and our region’s ability to move products to far-flung markets depends on an efficient transportation system.

With its location on Interstate 5, the West Coast artery of the Interstate Highway System, the greater Portland region is ideally situated to move freight by truck. But with Portland International Airport, two Class 1 railroads (mainline railroads Union Pacific and Burlington Northern/Santa Fe), the southern terminus of the 400-mile Olympic Pipeline, and a location at the confluence of two major rivers with ocean access, the region’s freight transportation system is a multimodal network.

Figure 4.28 Freight goods movement in the greater Portland region

Source: Cambridge Systematics, Port of Portland Commodity Flow Forecast, 2007 (most recent available)

The majority of the region's freight is still moved by truck as shown in **Figure 4.28**. However, as Oregon’s economy has shifted from bulk products like farm exports and timber to lighter products like semiconductors, electronics and specialized machinery, the region is moving fewer tons of goods around. But these lightweight products are higher-valued – as a result, the overall value of freight exports increased by 55 percent between 2007 and 2012.

⁴ Cost of congestion to the Economy of the Portland Region, November 2015

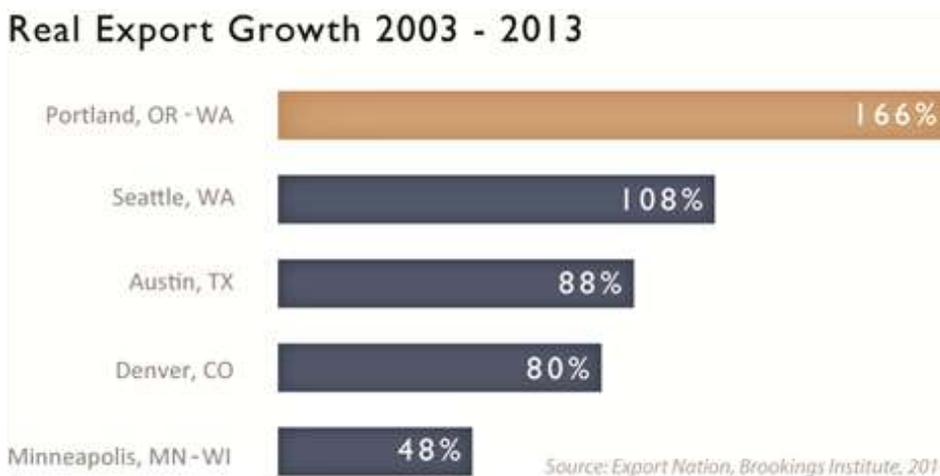

Figure 4.29 Freight weight to value, 2007-2012

Source: 2012 Commodity Flow Survey, US Census. Courtesy Joe Cortright, City Observatory 2016

Exports are at the core of the Portland’s Metro Service Area (MSA) economy. Between 2003 and 2013, the greater Portland region increased its export volume by 166 percent, creating 39,374 direct new jobs for the region. This growth made the greater Portland region the fifth-fastest growing export market among the 100 largest metropolitan areas. In 2013, the region was 13th largest in the U.S. by export volume, with \$26.7 billion in exports.⁵

Figure 4.30 Real export growth, 2003-2013

⁵ Global Trade and Investment Plan – Greater Portland Global, March 2015

4.5.1 Competing in a global economy

“Traded sector” industries that bring new money into the region and enable the rest of the economy to prosper, require an efficient transportation system. Portland’s economy depends on industries that could locate elsewhere, but have been attracted to the area because of its advantageous trading position. Those industries include semiconductor manufacturers, computer and electronics equipment, wood products, metal products, tourism, publishing, and wholesale distribution activities. Because traded industries depend on the movement of freight, reasonably good transportation access must be maintained if those industries are to remain and grow and in the Portland area in the years to come.

What is the “traded sector”?

As defined in ORS 285A.010, (8), “traded sector” means industries in which member firms sell their goods or services into markets for which national and international competition exists. As a result of their exchange earnings, these industries increase spending power within their region or state.

Traded sector industries are the primary enabler of Portland metropolitan economic growth. The Portland region’s traded sector industries are anchored by six core clusters.⁶ These industries are important drivers of regional economic activity today and well-positioned to spark future growth.

The six core clusters are defined below:

Clean Technology and Green Cities - Manufacturing, energy production, design, and waste disposal industries related to sustainability and resilience.

Computers and Electronics – Establishments that manufacture computers, computer peripherals, communications equipment, and similar electronics products.

Health Sciences and Technology – Advanced medical device manufactures, plus related research and development establishments; does not include local hospitals.

Metals and Machinery – Broad array of goods-producing establishments working with heavy metals, ranging from foundries to pump makers to ship builders.

Software and Media – Service establishments writing software, planning and managing computer systems, hosting data, and producing and distributing video and sound recordings.

Sporting Equipment, Apparel, and Design – A unique collection of global apparel companies, personal hardware manufactures, and various design establishments.

⁶ Portland Economic Value Atlas Market Scan (The Brookings Institute) August 2017

4.6 HOW WE KEEP OUR ENVIRONMENT HEALTHY

Choices about how we get around, where we live, and our economy all impact the health of our environment. Metro and the RTP have a role, in partnership with federal, state and local partners in developing and implementing plans and policies that keep our air, water and land healthy for generations to come.

Air quality

Overall, concentrations of **criteria air pollutants** in the greater Portland region have decreased dramatically over the last 30 years. Through a mix of industrial emissions regulations and transportation emissions reduction strategies, the greater Portland region successfully reduced lead, carbon monoxide and ozone (smog) to meet and maintain federal clean air standards. In October 2017, the region completed the last of its obligations under the Clean Air Act for previous violations of federal air pollution standards.

However, compared to other areas in Oregon, the greater Portland region has the highest risk to the population from **air toxics** due to business and population density. Along with national estimates of air toxics emissions, Portland monitoring studies confirm the presence of air toxics at levels that can cause adverse health effects.⁷ A 2012 Oregon Department of Environmental Quality study identified 14 of the 19 pollutants above health-based benchmarks. Eight of the 14 pollutants cause the most risk. While the study shows that most air toxics are found throughout the study area, higher concentrations are found in densely populated neighborhoods, near busy roads and highways and in areas with business and industrial activity.⁸ Low-income neighborhoods, tribal populations and communities of color that live in urban areas may be disproportionately exposed to air pollution, which is a barrier to economic opportunity and security.

The Oregon Department of Environmental Quality is continuing to work with Metro and other stakeholders to address localized hotspot pollution from light and heavy

Defining terms

Air quality

The degree to which the ambient air is pollution-free, assessed by measuring a number of indicators of pollution.

Criteria air pollutants

Carbon monoxide, lead, ground-level ozone, nitrogen dioxide, particulate matter, and sulfur dioxide. Criteria pollutants are the only air pollutants with national air quality standards that define allowable concentrations of these substances in ambient air.

Air toxics

Also known as toxic air pollutants or hazardous air pollutants, are those pollutants that cause or may cause cancer or other serious health effects, such as reproductive effects or birth defects, or adverse environmental and ecological effects.

Greenhouse gases

Greenhouse gases - The six gases identified in the Kyoto Protocol and by the Oregon Greenhouse Gas Mandatory Reporting Advisory Committee as contributing to global warming: carbon dioxide (CO₂), nitrous oxide (N₂), methane (CH₄), hydrofluorocarbons (HFCs), perfluorocarbons (PFCs), and sulfur hexafluoride (SF₆).

⁷ Portland Air Toxics Solutions Committee Report and Recommendations, Oregon Department of Environmental Quality, April 2012

⁸ Ibid

duty vehicle emissions.

Metro's Climate Smart Strategy responds to a state mandate to develop and implement a strategy to reduce per capita **greenhouse gas emissions** from cars and small trucks by 2035. In December 2014, after a four-year collaborative process, the Metro region adopted a Climate Smart Strategy that achieves a 29 percent reduction in per capita greenhouse gas emissions, which exceeds the state mandated target.⁹ The strategy does more than just exceed the state mandated target; it also supports job creation and economic development, saves businesses and household money, helps people live healthier lives, protects clean air and water, and makes the most of the investments already made in the region's transportation system.

The strategy relies on adopted local and regional land use and transportation plans and expected advancements in cleaner, low carbon fuels and more fuel-efficient vehicles. The strategy includes nine key policies that are reflected in Chapter 3.

Habitat

Without appropriate intervention and mitigation, transportation corridors create barriers and hazards in wildlife corridors and fish passageways. About 13 percent of the region is covered by developed land such as pavement and buildings.¹⁰ Several Metro-initiated activities are aimed at restoring habitat or mitigating the effects of the transportation system on the natural environment.

Development of the Regional Conservation Strategy for the Greater Portland-Vancouver Region reflects an ongoing effort to maintain an inventory of regionally significant fish and wildlife habitat and map ecologically sensitive areas for informing potential environmental impacts of transportation projects. The inventory is used in the RTP to identify and flag future transportation projects that overlap with sensitive fish and wildlife habitat in order to plan for, prevent or mitigate negative impacts.

It is the goal of the Regional Conservation Strategy to manage the region's resources in a way that does the following:

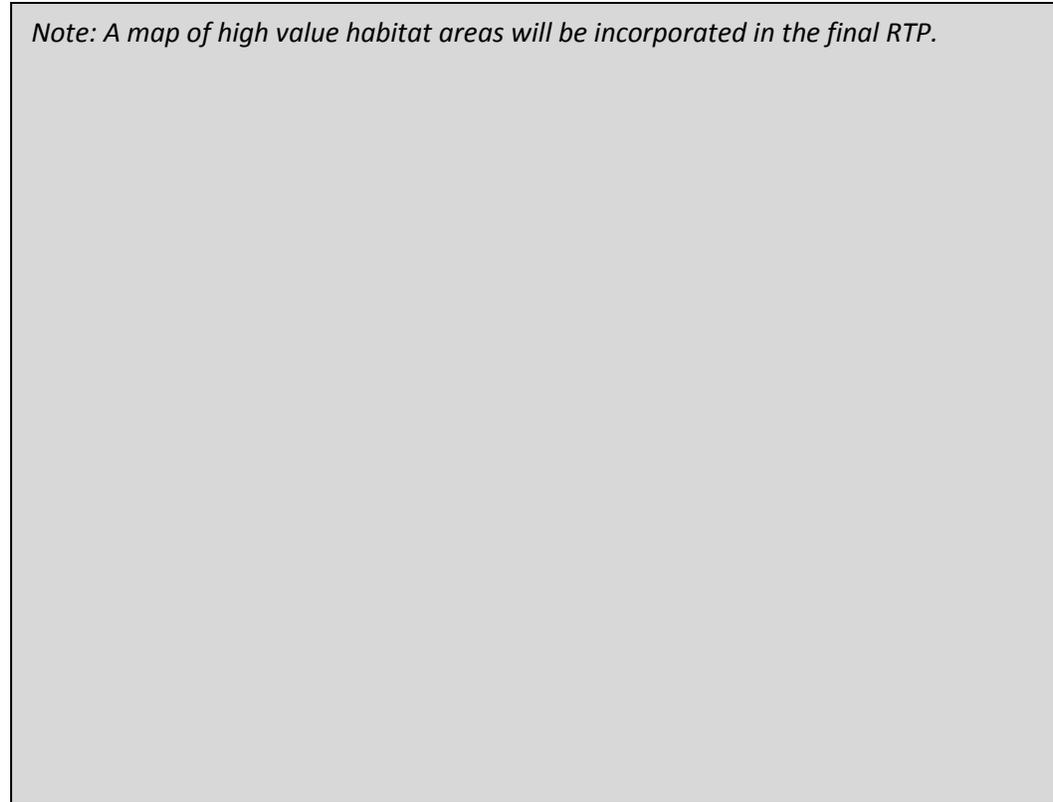

- Protects the water and air quality of the region
- Provides other important ecosystem services, such as flood control, water storage, and pollination
- Supports—at a minimum—the current level of biodiversity (i.e., the existing range of plants, animals, and wildlife habitats)
- Helps species and habitats recover from historical losses or degradation
- Increases natural systems' resilience and their ability to adapt to an unpredictably changing climate

⁹ Climate Smart Strategy for the Portland metropolitan region, Metro, 2014

¹⁰ Regional Conservation Strategy for the Greater Portland-Vancouver Region

- Provides opportunities for people to access natural areas for local recreation, research, and appreciation

Figure 4.31

Metro’s Parks and Natural Areas Program acquires land to protect habitat and water quality and conduct ongoing performance monitoring of habitat and watershed health.

Metro’s design guidance for streets and regional trails provides best practices to create livable streets that mitigate the negative impacts of transportation on water, air and habitat. The design guidelines were first developed in 2002. The Creating Livable Streets, Green Streets and Trees for Green Streets handbooks are currently being updated to reflect best practices associated with street design to lessen impacts on habitat and ecosystems and will include regional trail design guidance, in addition to the current Wildlife Crossings and Green Trails handbooks. Additionally, the Regional Active Transportation Plan provides Top 10 Natural Resource Considerations for Trail Planners. This set of considerations is provided to local jurisdictions that receive funding from Metro for regional trails and reflect best practices to protect habitat.

Future work by Metro and partners could include an inventory of culverts in the region that need repair or replacement to accommodate endangered or threatened fish species.

4.7 HOW THE SYSTEM IS WORKING – CHALLENGES AND OPPORTUNITIES AHEAD

Regional transportation challenges were identified through the engagement process during the update of the RTP. The regional investment strategy was developed to address these challenges.

- Aging infrastructure
- Climate change and air quality
- Congestion and reliability
- Fatal and life-changing crashes
- Earthquake vulnerability, security and emergency management
- Gaps in transit, biking and walking connections
- Social inequity and disparities
- Housing and transportation affordability and displacement
- Technological change

4.7.1 Funding

Today the federal government is investing less in infrastructure than ever before. While budgets are shrinking, aging roads and bridges are operating beyond capacity, and our transit systems lack funding to expand. Traditional approaches to financing transportation projects are not only failing to maintain existing infrastructure, they are wholly inadequate to build new systems to accommodate growth and keep our economy moving.

Oregon auto taxes and fees are the lowest in the nation according to Bankrate.com's most recent Car Cost index which lists the annual costs of car ownership for all 50 states. In 2014, Oregon's annual average cost for car ownership was about 31 percent lower than the national average. The largest difference in vehicle costs was for taxes and fees, which the index estimated to be \$157 a year, about 85 percent lower than the national average of \$1,058.

As of January 2018, Oregon automobile related taxes are the lowest among our neighboring western states as summarized below. The table does not include the federal excise gas tax of 18.4 cents per gallon.

Table 4.32 Comparison of Automobile Related Taxes

Tax (cents per gallon units)	OR	MT	ID	UT	NV	WA	CA
State gas excise tax	34.1¢	32.3¢	32.0¢	29.4¢	23.0¢	49.4¢	41.7¢
Gas sales & local option taxes	2.5¢	0¢	1.0¢	0¢	10.8¢	0¢	16.6¢
Registration fees	11.8¢	20.0¢	9.3¢	9.5¢	6.8¢	16.8¢	19.6¢
Ad valorem taxes	0¢	4.0¢	0¢	10.0¢	31.2¢	13.1¢	16.2¢
Auto sales taxes	4.0¢	0¢	38.4¢	43.8¢	51.2¢	60.8¢	54.4¢
Title & related fees	3.7¢	0.5¢	0.6¢	0.2¢	1.2¢	2.7¢	0.9¢
Total cents per gallon	56.1¢	56.8¢	81.3¢	92.9¢	124.2¢	142.6¢	149.3

Source: Oregon Department of Transportation (January 2018)

Note: An infographic of the table above will be incorporated in the final RTP.

Over the next two decades, the gap is expected to grow between the revenues we have and the investments we need just to keep our bridges, roads and transit systems in their current condition, to say nothing of addressing new needs. Current sources of transit funding are not enough to support the system expansions needed to serve its rapidly growing ridership.

4.7.2 Aging infrastructure – maintaining the system we have

The region’s aging infrastructure is deteriorating and requires more maintenance than ever before, similar to other cities and regions across the country. In its 2013 Report Card for America’s Infrastructure, the American Society of Civil Engineers gave America a D for roads, stating that 32 percent of the nation’s roads are in poor or mediocre condition.¹¹ The Oregon Department of Transportation, cities, and counties devote nearly all existing state and federal gas tax revenues to operation and maintenance of the existing road system. The federal fuel tax stands at 18.4 cents per gallon on gasoline and 24.4 cents per gallon for diesel; however the tax has not been increased since 1993, when gas was consistently under \$1.20 per gallon. If the tax has been indexed to inflation it would be about 30 cents per gallon now.¹²

Comprehensive maintenance data for the region is not currently available. The City Club of Portland estimated that the City of Portland needs at least \$50 million per year to keep streets from falling into further disrepair, at least \$75 million per year to repair streets that have fallen into disrepair, and at least \$80 million per year to repair and construct safety projects that benefit all mode of transportation for a total of \$205 million per year.¹³ It is clear that the region needs to address this growing problem. Cities across the nation

¹¹ Portland’s Streets, End the Funding Gridlock, City Club of Portland Bulletin, Vol. 98, No. 8, September 9, 2015

¹² Ibid

¹³ Ibid

have taken various approaches to raising local revenue, including numerous cities in the region including Hillsboro, West Linn, Lake Oswego and Sherwood. Currently leaders in the region are discussing options for regional funding, although it is clear there is no silver bullet that will solve the transportation funding problem.

4.7.3 Climate change and air quality

Climate change is the defining global challenge of the 21st century. Global climate change poses a growing threat to our environment, public health and our economy, and creates uncertainties for the region.

Documented effects of climate change include: extreme weather events, increase in average annual air temperatures and likelihood of extreme heat events, changes in hydrology, water supply and stream flows, rising sea levels, reduced water quality, changes in wetland ecosystems, increase in breeding grounds for water-borne diseases, shifting rainfall patterns, reduced air quality, increase in wildfire frequency and intensity, increased incidents of landslides, shifts in quality of habitat, shifts in migration patterns and habitat range, and changes to growing seasons such as increased incidents of short-term drought, and the distribution of plants and animals.

Climate change impacts will impact the service life of transportation infrastructure and the more severe storms that are predicted will increase the frequency of flooding and landslides. Consequent damage to roads, bridges and rail infrastructure will compromise system safety, disrupt mobility and hurt the region's economic competitiveness.

Our ability to respond, not just as the Portland region but as a state, will have unprecedented impact on our lives and our survival. The Oregon Sustainable Transportation Initiative (OSTI) is an integrated statewide effort to reduce greenhouse gas (GHG) emissions from transportation while creating healthier, more livable communities and greater economic opportunity. A component of this initiative is the Oregon Statewide Transportation Strategy (STS): A 2050 vision for Greenhouse Gas Emissions Reductions. The STS describes what it would take for the transportation sector to get as close as possible to the 2050 goal of a 75 percent reduction below 1990 levels of greenhouse gas emissions.¹⁴

¹⁴ Oregon Statewide Transportation Strategy: A 2050 Vision for Greenhouse Gas Emissions Reduction, Volume 1, Oregon Department of Transportation, March 20 2013

The STS focuses on prevention and mitigation of climate impacts, not adoption activities. It is neither directive nor regulatory, but identifies promising approaches for further consideration by policymakers at the national, state, regional, and local levels without assigning responsibility for implementation. The path forward for the greater Portland region, as well as the state as whole, will continue to evolve as more planning and analysis work is completed in the future.

The goal of the region’s Climate Smart Strategy is to demonstrate leadership on climate change by meeting adopted targets for reducing greenhouse gas emissions from light-duty vehicles while creating healthy and equitable communities and a strong economy. Adopted by JPACT and the Metro Council in 2014 with broad support, the strategy is built from the land use and transportation plans and visions already adopted by local jurisdictions across the region, creating a diverse and shared vision. It includes making investment to increase active transportation, increase transit and use technology and other strategies to improve safety, reduce traffic delay and make the most of investments we already made in our transportation system.¹⁵

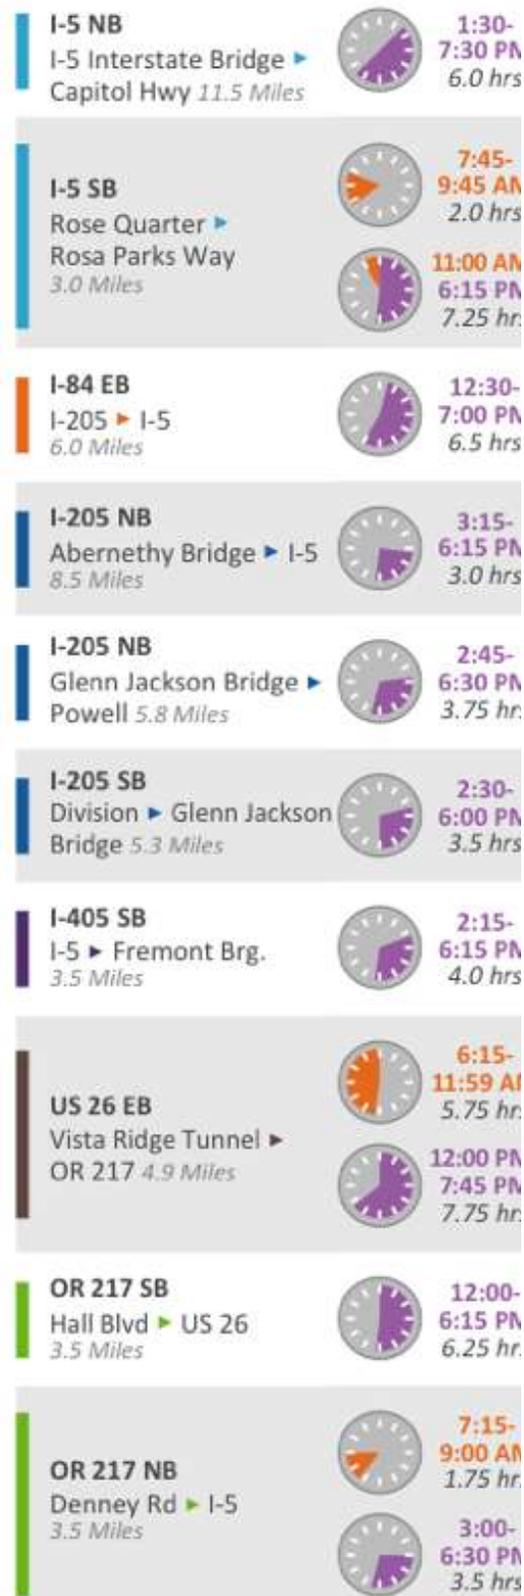

4.7.4 Congestion and reliability

Congestion has many causes, but mostly results from too much traffic for the physical capacity of a road to handle (bottlenecks) or periodic events like crashes, vehicle breakdowns, road work, storms and special events (parades, major sporting events). For drivers, this is usually described as routine congestion, which typically occurs daily, versus traffic incidents that are unexpected and difficult to predict.

Drivers can usually plan their day around routine congestion and the typical bottlenecks. Much of the throughway system (our major highways and

Top recurring bottlenecks, 2015

Sources: FHWA, NPMRD, ODOT

¹⁵ Climate Smart Strategy for the Portland metropolitan region,

freeways) is routinely congested during the morning and evening rush hour, and drivers know their trip will be slower during this period. But the traffic incidents and other non-routine events are difficult to plan for, and make it more difficult for drivers to plan commutes or for businesses to plan shipments.

Focusing on system reliability

For this reason, efforts to address congestion in our growing region have started to focus on improving reliability, or the degree to which congestion in a given travel corridor is affected by these non-routine events. Reliability is about predictability and dependability – and being able to count on knowing about how long it will take to get to school, work or activities. Improving reliability means that travelers don't have to budget as much extra time in order to arrive on time at their destinations, even when routine congestion exists on our major throughways.

ODOT report shows growth in congestion

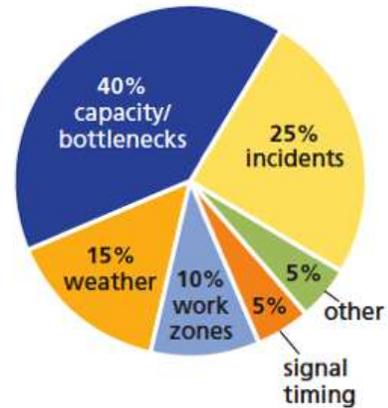

ODOT's *2016 Traffic Performance Report* shows what many of us have experienced: traffic congestion in the greater Portland region today can occur at any time of the day or week, and is no longer only a weekday peak hour problem. In 2013, about 11 percent of all travel in the greater Portland region occurred during congested periods. This increased to nearly 14 percent in 2015. This increase in congestion is a reflection of the both the region's continued growth, including our substantial economic rebound from the Great Recession that began in 2008.

Data from the ODOT report for the region's six major throughways (Interstate 5, Interstate 84, Interstate 205, Interstate 405, U.S. 26 and OR 217) shows increasing congestion, decreasing travel speeds, greater delays and unreliable trip times on these major travel routes. The graphic to the right identifies the top recurring bottlenecks in the region.

Congestion on these routes also affects freight in the region, as most of our local goods move by truck today, a trend that is expected in future. With congestion beginning to spread beyond commute periods and into the off-peak in the middle of the day, the ability to move freight during this relatively congestion-free period is being impacted. As the mid-day becomes more unreliable, freight in our region is having more problems meeting delivery schedules, and the cost of shipping is increasing. These shipping costs are typically passed on to businesses and consumers, and could impact the region's competitiveness in the global economy.

Did you know?

Causes of congestion in the greater Portland region

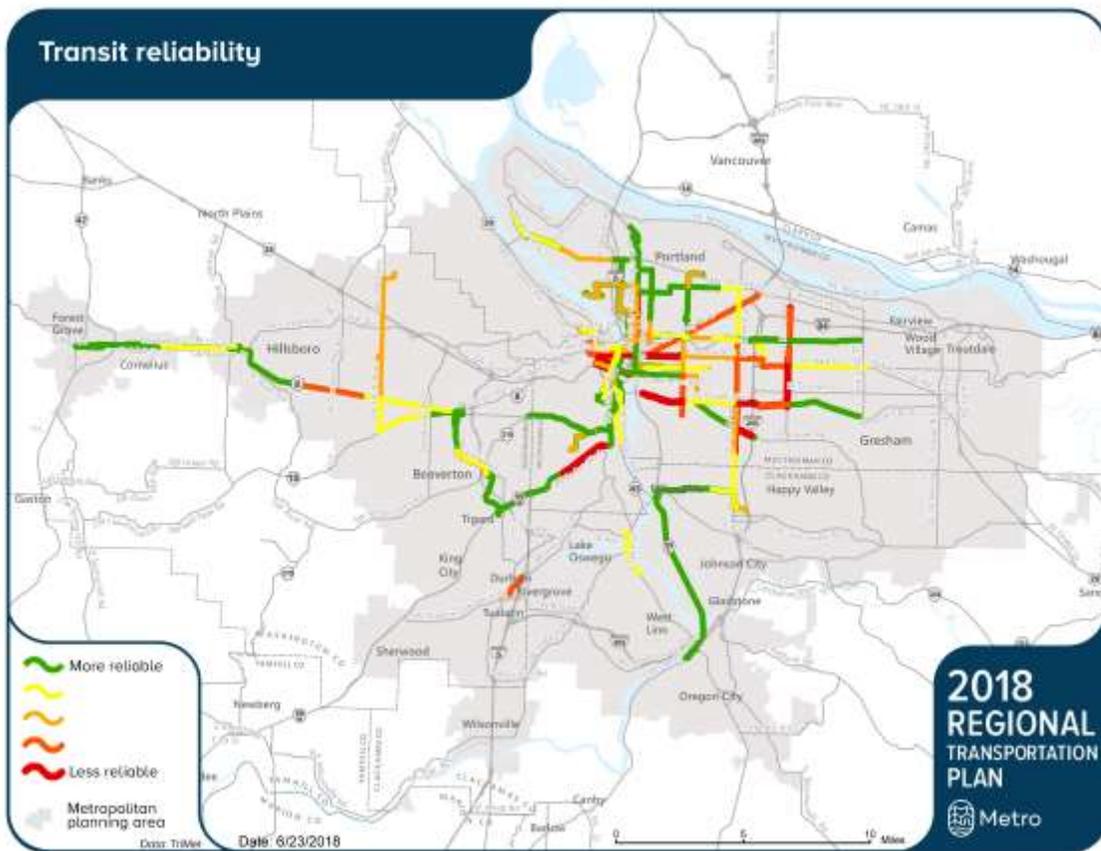

More than half of all congestion is caused by crashes, breakdowns and other causes that can be addressed using system management and operational strategies.

Congestion is also affecting the speed and reliability of transit throughout the region

The ODOT report also found that crashes on our throughways are increasing at a rate equal to the increase in congestion, but shows that recent ODOT investments in traveler information signage and adding auxiliary lanes have slowed the rate of crashes at specific bottleneck locations. While not a long-term solution for growing congestion, an auxiliary lane adds capacity in the form of a dedicated lane from an on-ramp to the next off-ramp, helping to reduce crashes caused by drivers merging and weaving between exits.

Figure 4.33 Transit reliability in the greater Portland region

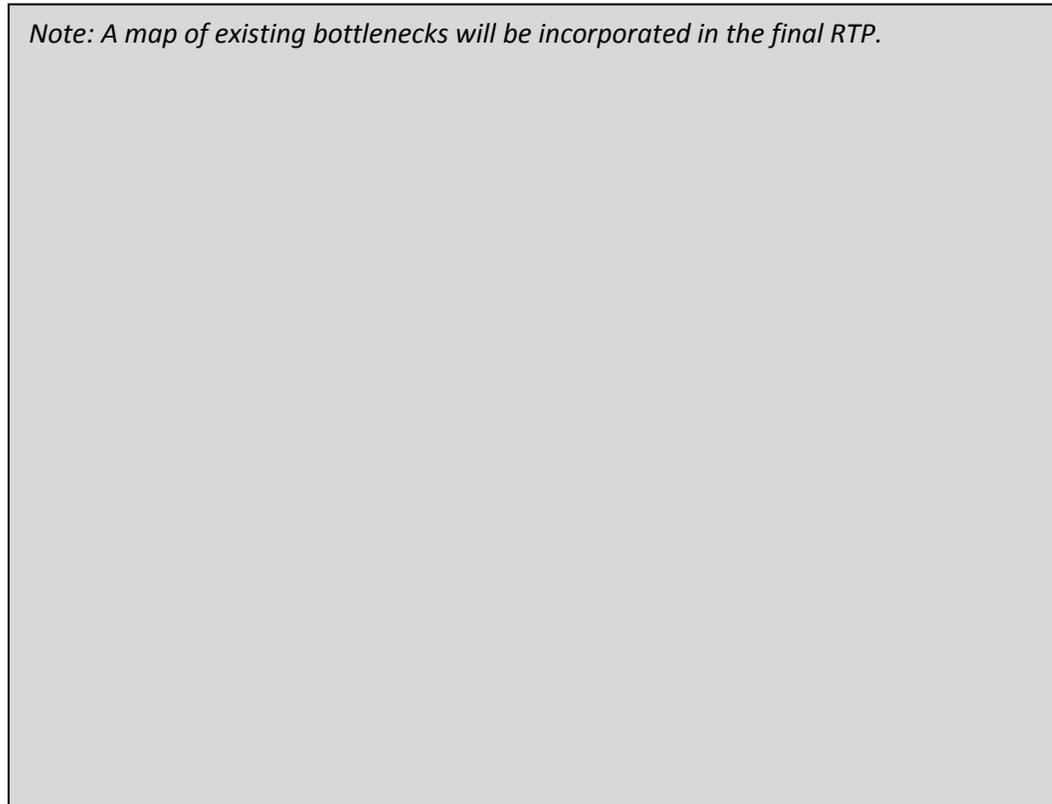

Oregon Legislature commits to addressing congestion in the greater Portland region

In 2017, the Oregon Legislature approved HB 2017 (discussed in the next section), which provides funding for additional targeted safety and congestion projects that can help address the issues found in the ODOT report. The Legislature also directed the Oregon Transportation Commission (OTC) to develop a proposal for value pricing on I-5 and I-205 from the Columbia River to the junction of the two freeways in the southern part of the region, with the stated purpose of reducing congestion. The OTC must seek approval from the Federal Highway Administration to implement value pricing no later than December

31, 2018. If FHWA approves, the commission is required to implement value pricing. An ODOT-led study is underway to meet this deadline.

According to rankings released in March 2016 by INRIX, a transportation tracking company, the Portland region’s major congestion hotspots are those highways leading to and from downtown Portland, the southern tier highways as well as the two interstate connections to Washington, as seen below.

Figure 4.34 Bottlenecks in the greater Portland region

In 2014, Texas A&M’s annual Urban Mobility Scorecard showed the Portland area tied with Austin, Miami, Detroit and Atlanta for 12th place out of 101 regions in yearly delay per auto commuter. The delay per auto commuter is reported as 52 hours per year – exactly the average amount of delay for all 101 cities in the study. The cost of our region’s congestion to truck freight was ranked at 16th out of 101 regions, with an estimated annual cost of \$375 million.¹⁶

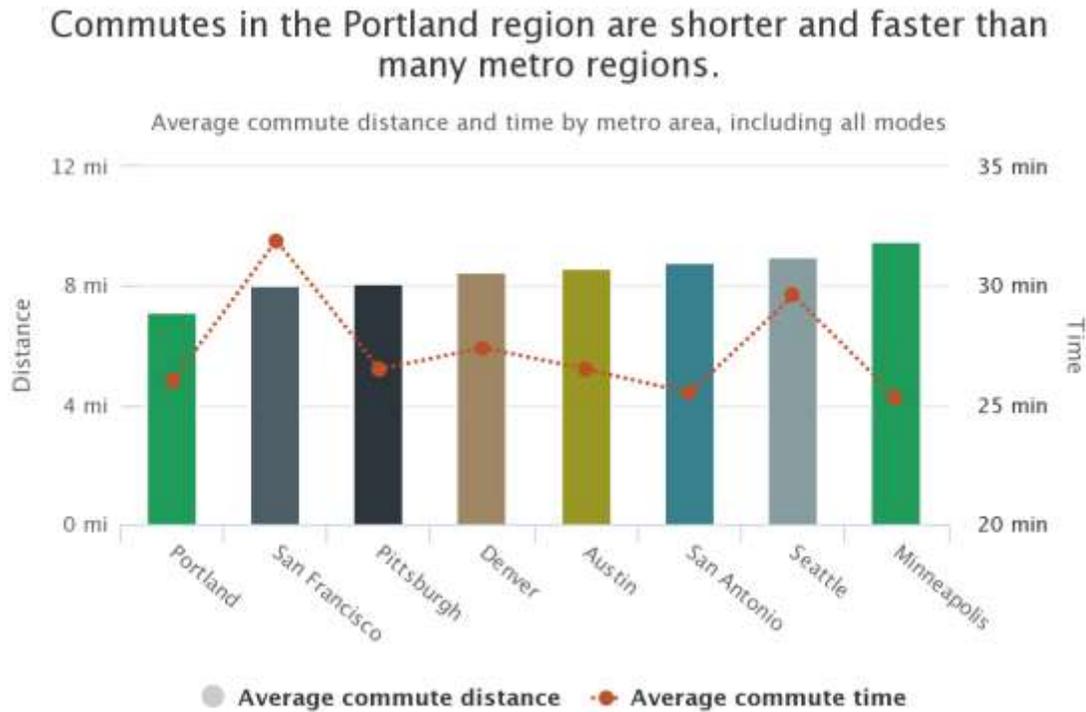

Despite such delays, we spend less time commuting to work than people in most other regions. In 2014 the average commute was 26 minutes – about a minute longer than in 2010¹⁷. The Portland region is tied for fifth-best metro area in the nation for the share of

¹⁶ Texas A&M Transportation Institute 2015 Urban Mobility Scorecard

¹⁷ 2014 American Community Survey 1-Year Estimates, Means of Transportation to Work by Selected Characteristics

people with a 30-minute commute or better – nearly two-thirds of commuters in the region have a commute under a half-hour. In part that’s because people here don’t have to travel as far to get to work. The average commute distance in the region is just 7.1 miles.

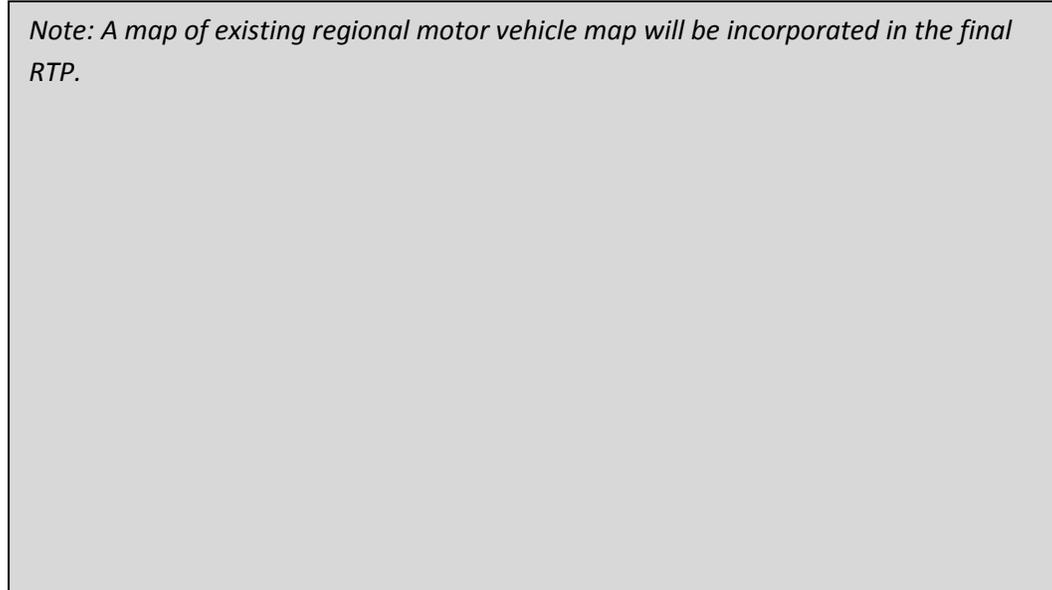

Figure 4.35 Average commute distance and time for metropolitan areas

Metropolitan Policy Program at Brookings, "The growing distance between people and jobs in metropolitan America," March 2015.

Metro maintains the Congestion Management Process (CMP) for the Portland metropolitan region as required by federal law. The CMP includes a performance management system that informs needed capital investments, such as new or improved transit and road capacity as well as demand and system management strategies to improve performance of the existing infrastructure. The Regional Transportation Plan calls for strategic widening of existing roads and throughways to address bottlenecks, increasing street network connectivity, expanding travel options, and using system and demand management strategies to help improve reliability and better connect goods to market and support travel across the region. The CMP is described more in Chapter 8.

Figure 4.36 Regional motor vehicle existing system map

4.7.5 Fatal and life-changing crashes

Traffic safety affects the greater Portland region on multiple levels. Crashes cause personal tragedy, lost productivity, rising insurance costs, congestion and delay to the movement of people and goods. In addition, safety concerns may prevent people from choosing to walk or bike rather than driving a car. Increasing awareness of safety issues is a first step to improving safety in the region. Efforts to improve transportation safety generally center on preventing traffic crashes that result in severe injury or death.

Traffic related deaths and severe injuries are a critical and preventable public health and social equity issue in the greater Portland region. Between 2011 and 2015, there were more than 116,000 traffic crashes resulting in 311 deaths and 2,102 people severely injured.¹⁸ **Figure 4.35** provides a map showing the location of fatal and life-changing injuries in the greater Portland region between 2011 and 2015.

Traffic crashes are the leading cause of unintentional injury death for young people ages 5 to 24 in Multnomah, Washington and Clackamas County, and the second leading cause of unintentional injury death for people ages 25 to 84.¹⁹

On average, 62 people die each year on the region's roadways and 420 people experience a life changing injury. Nearly two people are either killed or severely injured every day in our

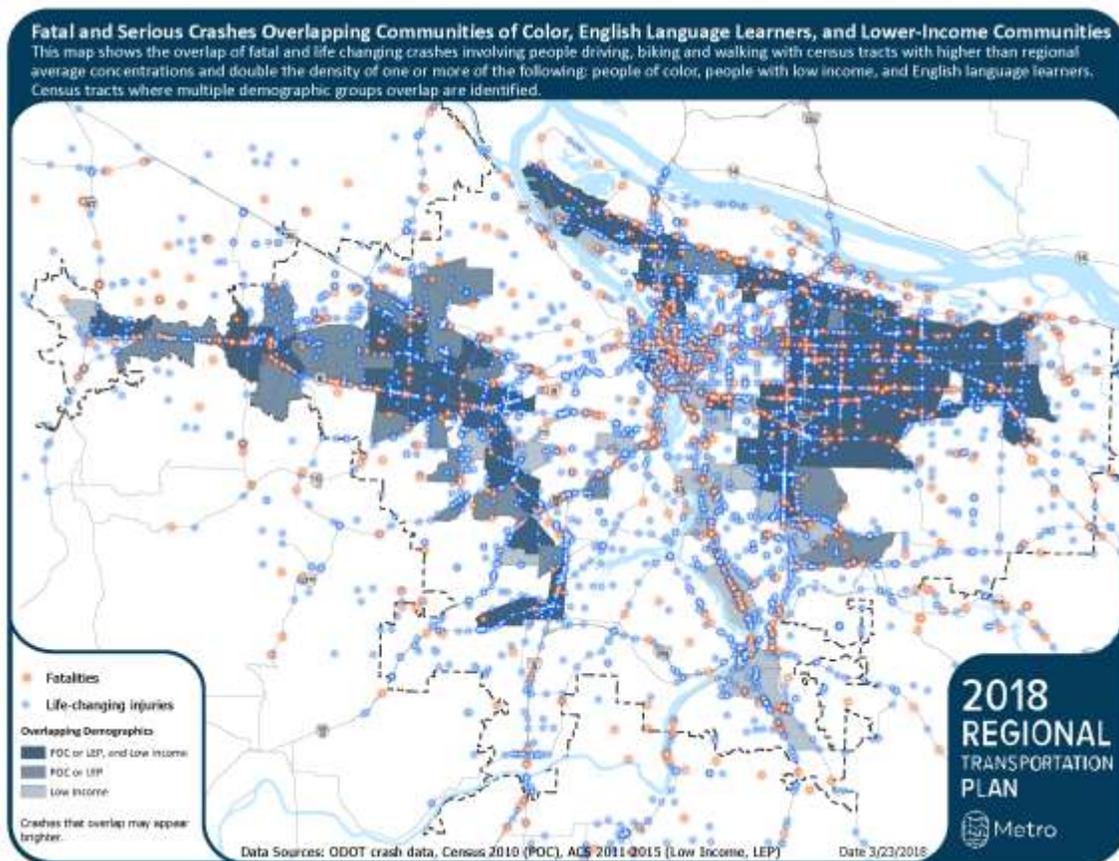

¹⁸ 2018 Metro State of Safety Report

¹⁹ Oregon Death Certificates: Center for Health Statistics, Center for Public Health Practice, Public Health Division, Oregon Health Authority. Accessed March 13, 2018. For 2012-2016. Unintentional injuries were the 4th leading cause of death (just about tied for third with cerebrovascular disease/stroke); within the category of unintentional injury deaths, transport injuries are the third leading cause behind falls and poisoning (poisoning includes drug overdoses).

region in a traffic crash; every 10 days a person riding a bike is killed or severely injured; every 5 days a person walking is killed or severely injured.

Sixty percent of these fatal and severe injury crashes occur on just 6 percent of the region's major streets. These roadways are identified in this document as Regional High Injury Corridors and Intersections. They are also where we tend to travel the most, where we run to catch the bus, cross the street to get to schools and shops, ride our bikes or drive. Refer to Chapter 3 for a map of Regional High Injury Corridors and Intersections.

Figure 4.37 Fatal and life changing injuries in the greater Portland region, 2011-2015

Analysis in the 2018 Metro State of Safety Report and the Regional Transportation Safety Strategy identified the top three challenges that the region faces in eliminating fatal and life-changing injuries:

Traffic deaths are increasing and are disproportionately impacting people of color, people with low incomes and people over age 65

- Serious crashes (fatal and severe injury crashes combined) have fluctuated since 2007, but more recently have been increasing. Initial data from 2016, 2017 and 2018 indicate that the trend is continuing. This is a trend that is also happening at the state and national levels.

- The regional annual fatality rate by population and vehicle miles traveled (for 2011-2015) has increased compared to the 2012 Metro State of Safety Report.²⁰
- Your risk of dying in a motor-vehicle involved crash is higher if you are a person of color, are over 65 or have a lower income.²¹
- A majority of Regional High Injury Corridors are in communities with higher densities of people of color, people with low incomes and English language learners.²²
- A majority of pedestrian deaths are in are in communities with higher densities of people of color, people with low incomes and English language learners.
- Older drivers are twice as likely to die in a traffic crash. For male drivers age 70 to 79 and female drivers age 75 to 85 and older the share of serious crashes is double that of drivers in other age groups.
- In Oregon, American Indians/Alaska Natives have the highest average rate of vehicle related deaths (5.9 per 100,000) 1.8 times the rate among whites (3.3 per 100,000), and American Indians/Alaska Natives and Black or African American had the highest hospitalization rate -52.2 and 46.2 per 100,000, compared to 45.5 for whites and 20.8 Asian Pacific Islander for traffic related injuries.²³ This data is not currently available at the regional level.

Traffic deaths are disproportionately impacting people walking

- Auto-only crashes comprise ninety-one percent of all crashes, and thirty-eight percent of all fatal crashes. Pedestrian crashes make up two percent of all crashes, and thirty-six percent of all fatal crashes.
- Pedestrian traffic deaths are steadily increasing, are the most common type of fatal crash, and have the highest severity of any crash type.
- Pedestrian fatalities have steadily increased to 2015 at the local, regional, state and national levels.
- In the region, a pedestrian crash is more than 26 times as likely to be fatal than a crash not involving a pedestrian, and more than 110 times as likely to be fatal as a rear end crash, the most common crash type.

²⁰ Fatality rates for traffic related crashes are the proportion of all crashes, person deaths or severe injuries for every 1 million people or every 100 million vehicle miles traveled.

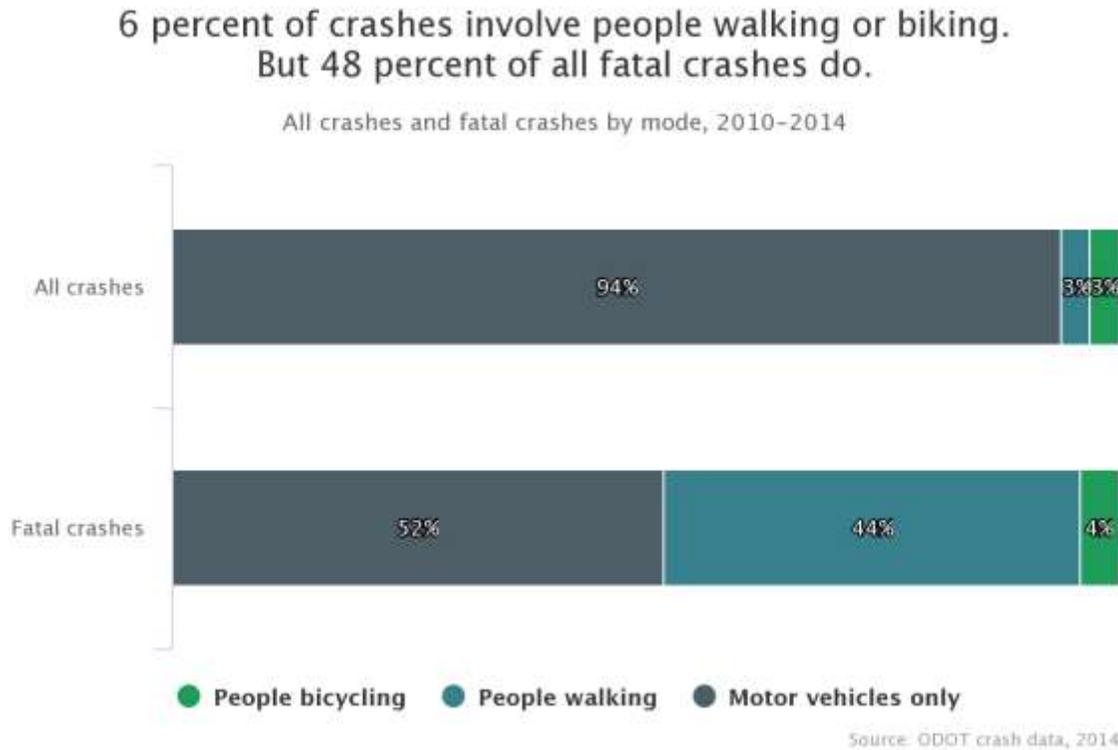

²¹ *Motor Vehicle Traffic-Related Pedestrian Deaths — United States, 2001–2010*, Centers for Disease Control and Prevention (2013); *Dangerous by Design*, National Complete Streets Coalition (2016); *Income Disparities in Street features that Encourage Walking*, Bridging the Gap (2012); *Pedestrians Dying at Disproportionate Rates in America's Poorer Neighborhoods*, Governing, August 2014; *America's Poorer Neighborhoods Plagued by Pedestrian Deaths*, Governing Research Report (August 2014)

²² The map at the end of this section shows the overlap of Regional High Injury Corridors and census tracts with both higher than regional average concentration and double the regional density of people of color, people with low income, and/or English language learners.

²³ Oregon Public Health Authority, 2008-2014 crashes

- Roadway design is critical to pedestrian safety. Seventy-seven percent of serious pedestrian crashes occur on arterial roadways in the region. This pattern is seen at the state level as well.

Figure 4.38 Percent of fatal crashes for people walking and bicycling, 2010-2014

A majority of traffic deaths are occurring on a subset of arterial roadways

- Arterial roadways are the location of the majority of the serious crashes in the region. Sixty-six percent of all serious crashes occur on a roadway designated as an arterial.
- In the region, seventy-three percent of non-freeway serious crashes occur on a roadway designated as an arterial; seventy-seven percent of serious pedestrian crashes occur on a roadway designated as an arterial; sixty-five percent of serious bicycle crashes occur on a roadway designated as an arterial.
- A majority of Regional High Injury Corridors are arterial roadways.
- A majority of the High Injury Corridors and Intersections – and a majority of pedestrian deaths and severe injuries – are in areas with race and income marginalized communities.

Several factors influence the number and severity of injuries from crashes, but some factors stand out from the rest. User behavior is a contributing factor in nearly every crash, from alcohol or drugs to excessive speed and aggressive driving. Driver inattention

also plays a major role, although it is difficult to accurately measure its impact. And even as technology has made driving much safer in many respects, it has introduced new challenges. Distracted driving has increased in step with the proliferation of cell phones in society, introducing a relatively new hazard onto the roadways. A 2016 study by the Oregon Department of Transportation shows that between 2000 and 2014, distracted driving contributed to a crash every 2.5 hours and a traffic-related injury every three hours.²⁴

A disproportionate amount of serious crashes occur on arterial streets – high-speed, high-volume streets that have four or more lanes. Per mile travelled, arterial and collector roadways experience more serious crashes than freeways and their ramps. Although these arterials make up only 6 percent of the region’s roads, 73 percent of serious and fatal crashes occur on them. Many of these dangerous streets extend through neighborhoods with high concentrations of communities of color and people with low incomes, where people are more likely to be walking, biking or using transit. As a result, these communities also bear a disproportionate amount of the region’s serious crashes.

While eliminating traffic related deaths and severe injuries can seem like a daunting goal, partners in the greater Portland region are taking action to address the issue head on.

Clackamas County has been a leader in setting aggressive safety targets. The county was the first local government in the state to develop a safety action plan. It uses the Toward Zero Deaths framework. The City of Portland has adopted a Vision Zero for 2025 and developed an ambitious Vision Zero Plan with an equity lens. In 2016, the City of Hillsboro adopted a safety action plan with a target of zero by 2035. Beaverton completed a Transportation Safety Action Plan in 2017 with a goal of zero fatalities and severe injuries by 2035. Washington County has completed a plan with a vision of moving towards zero deaths. In 2016, Oregon adopted its Transportation Safety Action Plan with a target of zero serious crashes by 2035.

4.7.6 Earthquake vulnerability, security and emergency management

In the next 50 years there is a significant risk that Oregon will experience a 9.0 Cascadia Subduction Zone earthquake and tsunami. As noted in the Oregon Resilience Plan, when a large earthquake is triggered within the Cascadia subduction zone, the result will be wide spread disruption of the transportation system. This disruption will make rescue and recovery operations in many areas difficult, if not impossible, and will have an immediate, disruptive impact on the economy. Thus the resilience of the transportation network is

²⁴ Distracted Driving: An Epidemic A Study of Distracted Driving Attitudes, Behaviors and Barriers Preventing Change, prepared for the Oregon Department of Transportation, Southern Oregon University, March 2016

considered a key factor for re-establishing other lifelines after a major Cascadia subduction zone earthquake.²⁵

The plan's Transportation Task Group assessed the seismic integrity of Oregon's transportation system, including bridges and highways, rail, airports, water ports and public transit systems, examined the special considerations pertaining to the Columbia and Willamette River navigation channels, and characterized the work deemed necessary to restore and maintain transportation lifelines after a Cascadia earthquake and tsunami. Recommendations in the plan for improving the resilience of transportation are based on the assumption that incremental improvements will be made over a 50-year timeframe. While these improvements are costly and spread out over a long time period, they must be initiated as a resilient transportation network is critical for re-establishing other lifelines, such as water, electricity, fuel, communication, and natural gas, after the earthquake. As noted in *One Oregon: A Vision for Oregon's Transportation System*, a \$92 billion economic loss can be avoided through a \$1.8 billion investment in seismic resiliency.²⁶

Terrorist events and natural disasters such as Super Storm Sandy provide good illustrations of the challenges facing metropolitan areas in preparing for and responding to unexpected security incidents or natural disasters. Effective coordination and communication among the many different operating agencies in a region and across the nation is absolutely essential.²⁷ Such coordination is needed to allow enforcement/security/safety responses to occur in an expeditious manner, while at the same time still permitting the transportation system to handle the potentially overwhelming public response to the security incident or natural disaster.

The Regional Disaster Preparedness Organization (RDPO) is a partnership of governmental agencies, non-governmental organizations and private sector stakeholders in the Portland metropolitan region collaborating to increase the region's resiliency to disasters. The RDPO formed in 2012 out of a desire to build upon and unify various regional preparedness efforts in the region including the Regional Emergency Management Group (REMG), the Urban Areas Security Initiative (UASI) Program and several discipline specific coordination groups. The mission of the RDPO is to build and maintain regional disaster preparedness capabilities through strategic and coordinated planning, training and exercising, and investment in technology and specialized equipment.

The RDPO-funded Oregon Department of Geology and Mineral Industries (DOGAMI) Enhanced Earthquake Impact Study (2017) assessed seismic vulnerability of bridges in

²⁵ The Oregon Resilience Plan, Reducing Risk and Improving Recovery for the Next Cascadia Earthquake and Tsunami, Oregon Seismic Safety Policy Advisory Committee, February 2013

²⁶ *One Oregon: A Vision for Oregon's Transportation System*, May 2016

²⁷ *The Role of the Metropolitan Planning Organization (MPO) In Preparing for Security Incidents and Transportation System Response*, Michael D. Meyer, Ph.D., P.E. Georgia Institute of Technology. Accessed November 10, 2007 at <http://www.planning.dot.gov/Documents/Securitypaper.htm>.

the region. The Sellwood Bridge and Tillikum Crossing Bridge have been built to be seismically resilient. In addition, planning work is under way for a seismic retrofit of the Burnside Bridge.

Figure 4.39 Seismic Vulnerability of the Bridges in the greater Portland region

Note: A map showing the seismic vulnerability of the region’s bridges will be added to the final RTP.

Figure 4.40 Designated Regional Emergency Transportation Routes (2006)

The RTP calls for updating the region’s emergency transportation routes (last updated in 2006) and implementing investments to increase system monitoring for operations, management and security of the regional mobility corridor system. These types of investments would enhance existing coordination and communication efforts in the region, and recognize these facilities would serve as the primary transportation network in the event of an evacuation of the region. The plan also directs Metro to work with local, state and regional agencies to identify critical infrastructure in the region, assess security vulnerabilities and develop coordinated emergency response and evacuation plans. Finally, transportation providers are directed to monitor the regional transportation and minimize security risks at airports, transit facilities, marine terminals and other critical infrastructure.

4.7.7 Gaps in transit, biking and walking connections

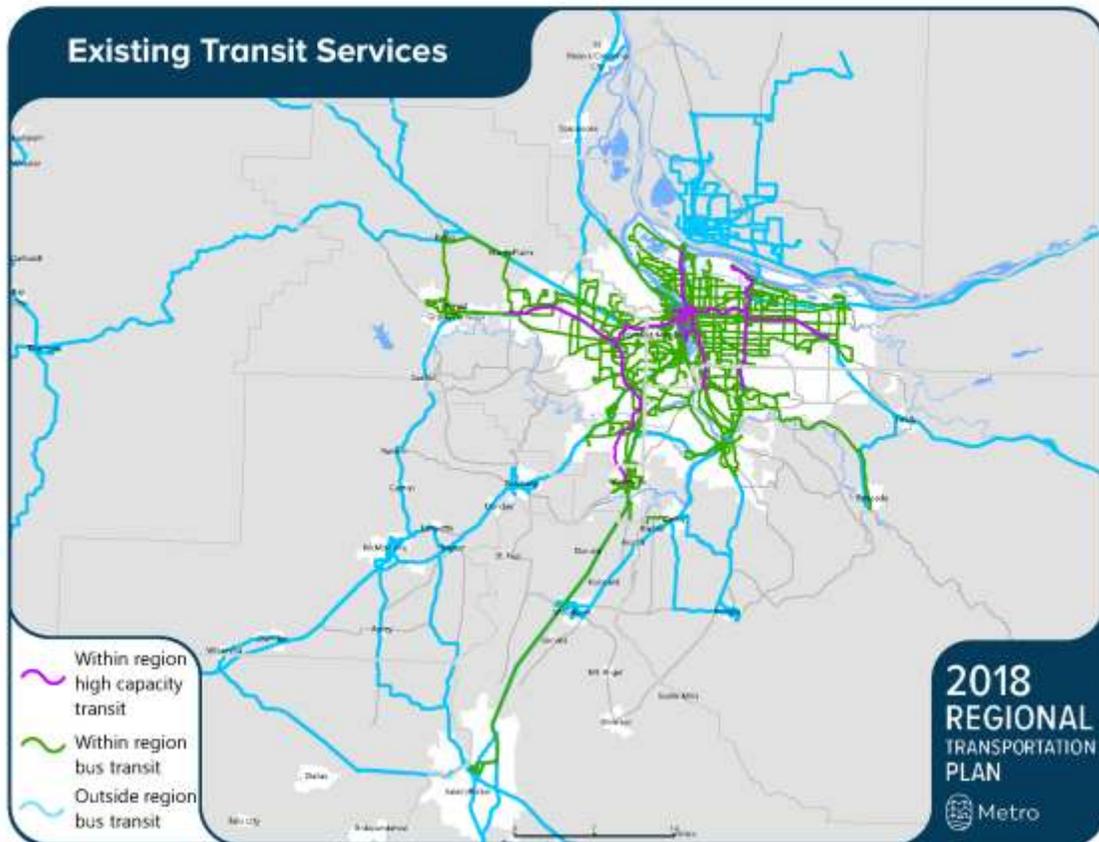

Increasing transit service is a key component of Metro’s Climate Smart Strategy for the Portland metropolitan region. The strategy identified making transit convenient, frequent, accessible and affordable as one of the most promising approaches to meet adopted targets for reducing greenhouse gas emissions from light-duty vehicles while creating healthy and equitable communities and a strong economy. To meet this goal new performance targets to increase the number of jobs and households, including low-income

households, within a ¼ mile of 15-minute service or better by 2035 were identified. In addition air quality-related federal laws require consistent service growth over time.

The transit system is especially important in ensuring mobility for people with low-income and people of color, who are twice as likely to be frequent transit riders as higher-income persons or white people. It is also critical to ensuring mobility for people who can't drive due to age or disability, or who simply choose not to own a personal vehicle. There are numerous ways to measure the busiest transit lines in the region, two options are the total number of passengers boarding and the productivity of the line – that is, the number of people boarding for every hour it operates.

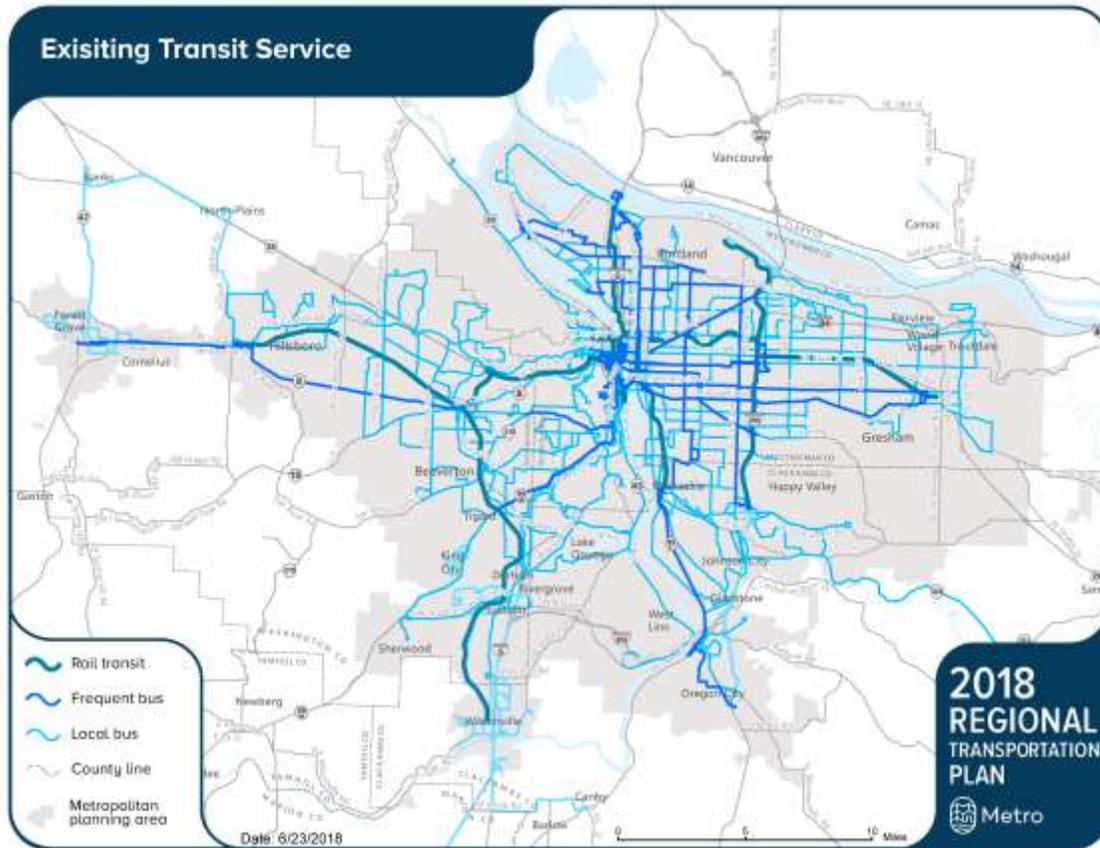

Figure 4.39 shows the existing transit system for the greater Portland region and beyond. Adding additional transit lines is part of the region's strategy to addressing the challenge of transit gaps.

Figure 4.41 Existing transit services in the greater Portland region and beyond

Increasing level of transit service can be just as critical to filling “transit gaps” as is adding new lines. **Figure 4.40** shows existing level of service on the transit system today.

Figure 4.42 Existing transit service, greater Portland region and beyond

Gaps in sidewalks, bikeways and regional trails are hindering the region’s ability to take full advantage of these affordable and healthy forms of transportation. Gaps in walking and bicycling facilities are impacting safety for the region’s most vulnerable roadway users and deterring people from using these modes of transportation and from accessing transit.

Figure 4.43 Percent of regional active transportation network complete

Planned regional pedestrian network (sidewalks at least one side of roadway)	60%
Planned regional bicycle network (on-street bikeways)	54%
Planned regional trail network (on the regional bike and pedestrian networks)	36%

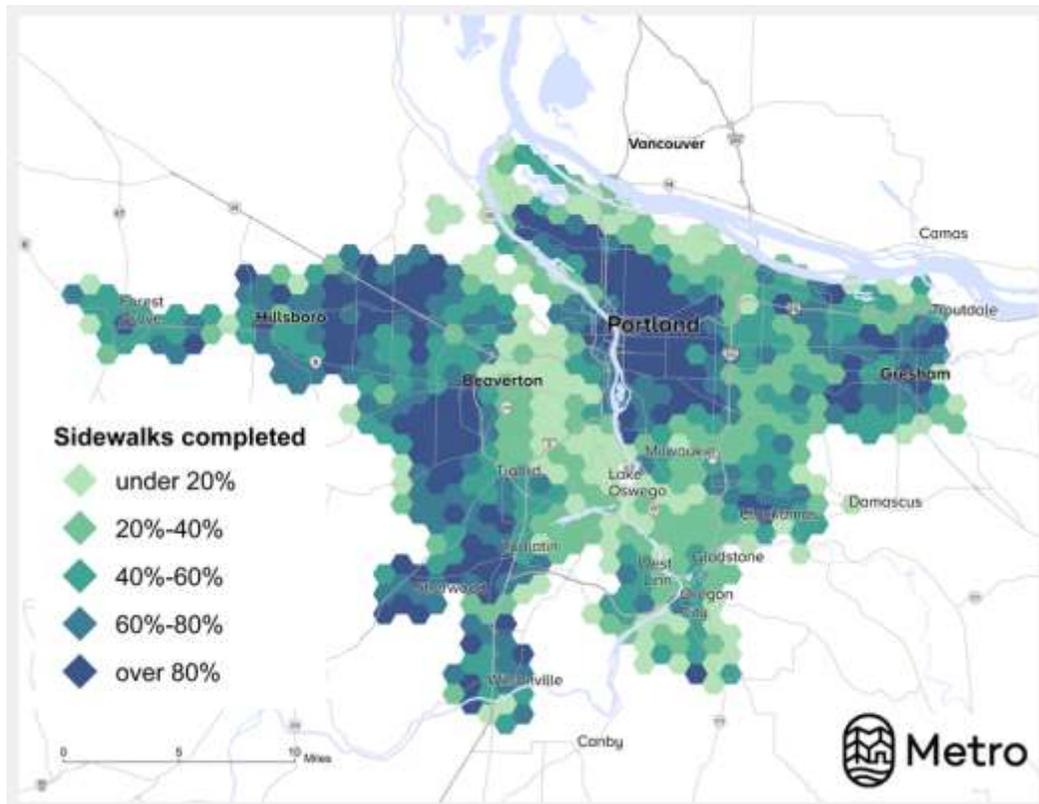

Approximately 60 percent of the planned regional pedestrian system has completed sidewalks on at least one side of the road.

Figure 4.44 Regional pedestrian existing system

Note: A map of existing regional pedestrian network gaps will be incorporated in the final RTP.

Significant portions of the region have pedestrian connections while other areas are lacking sidewalks, as seen in **Figures 4.42 and 4.43**.

Figure 4.45 Level of sidewalk completion in the greater Portland region, 2012

Approximately 54 percent of the planned regional bicycle network is complete. However, some existing facilities need to be improved to accommodate higher volumes of bicycle riders or to increase safety and level of comfort to attract more bicycle riders and prevent serious crashes. **Figure 4.44** shows the planned regional bicycle network, existing facilities and gaps that need to be filled.

Figure 4.46 Regional bicycle existing system

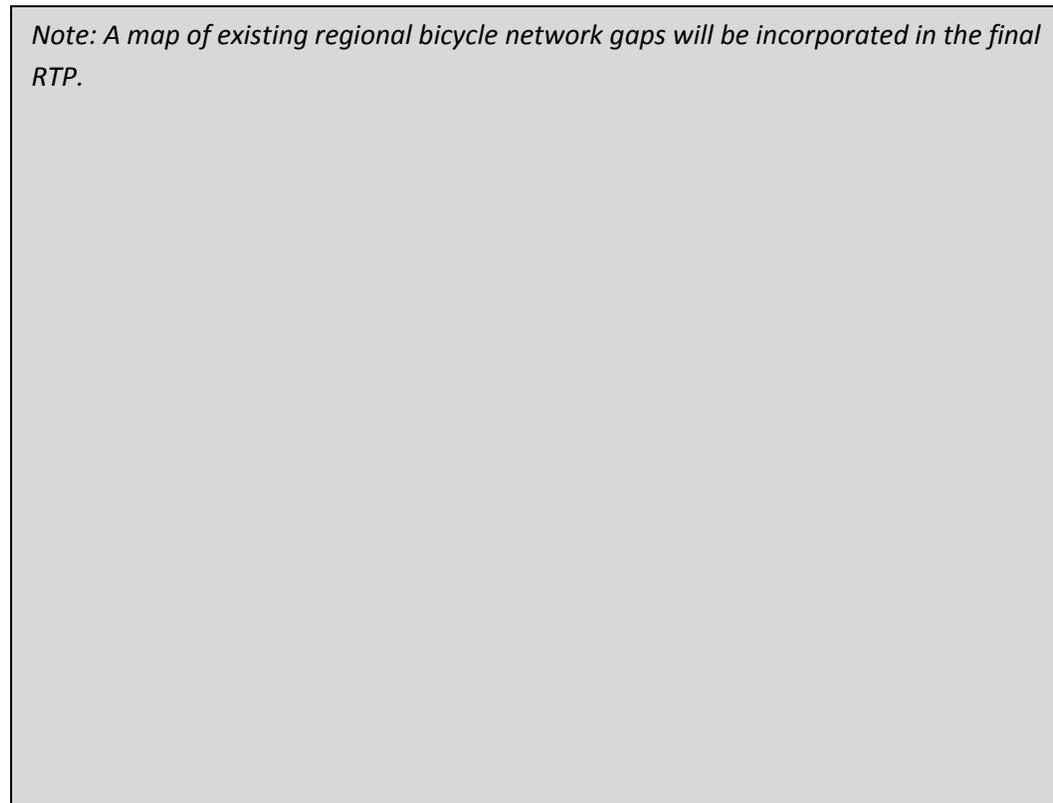

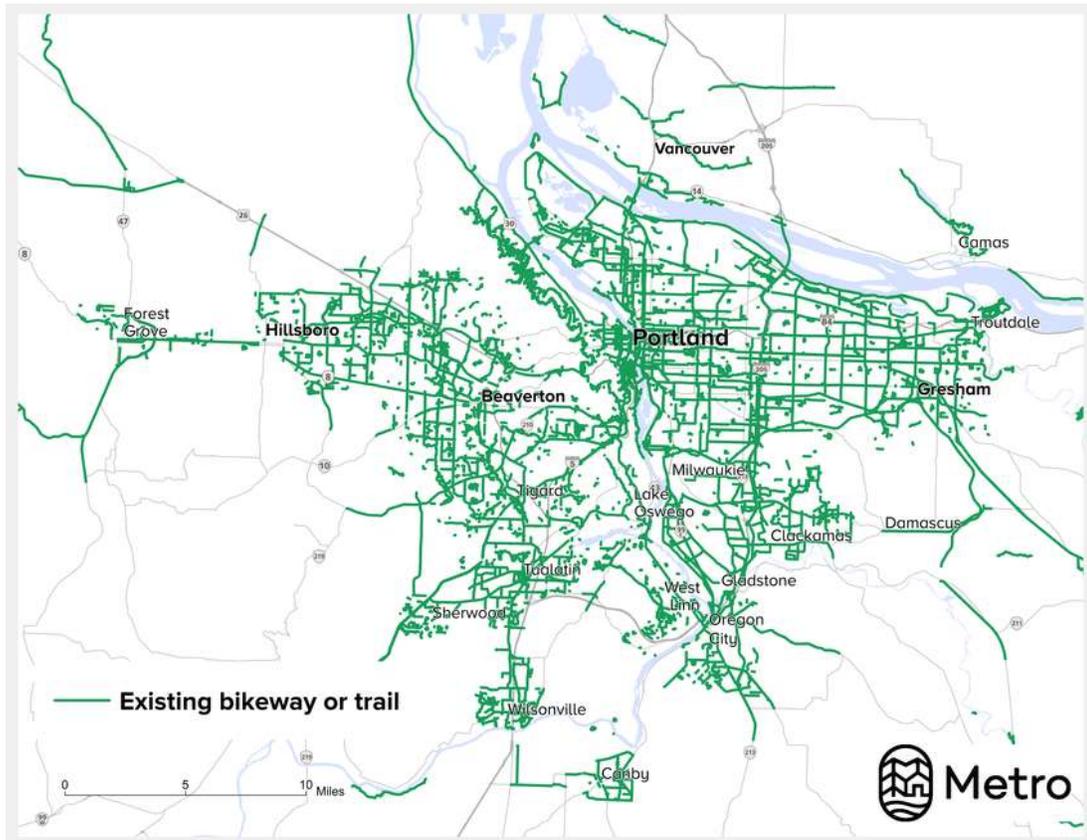

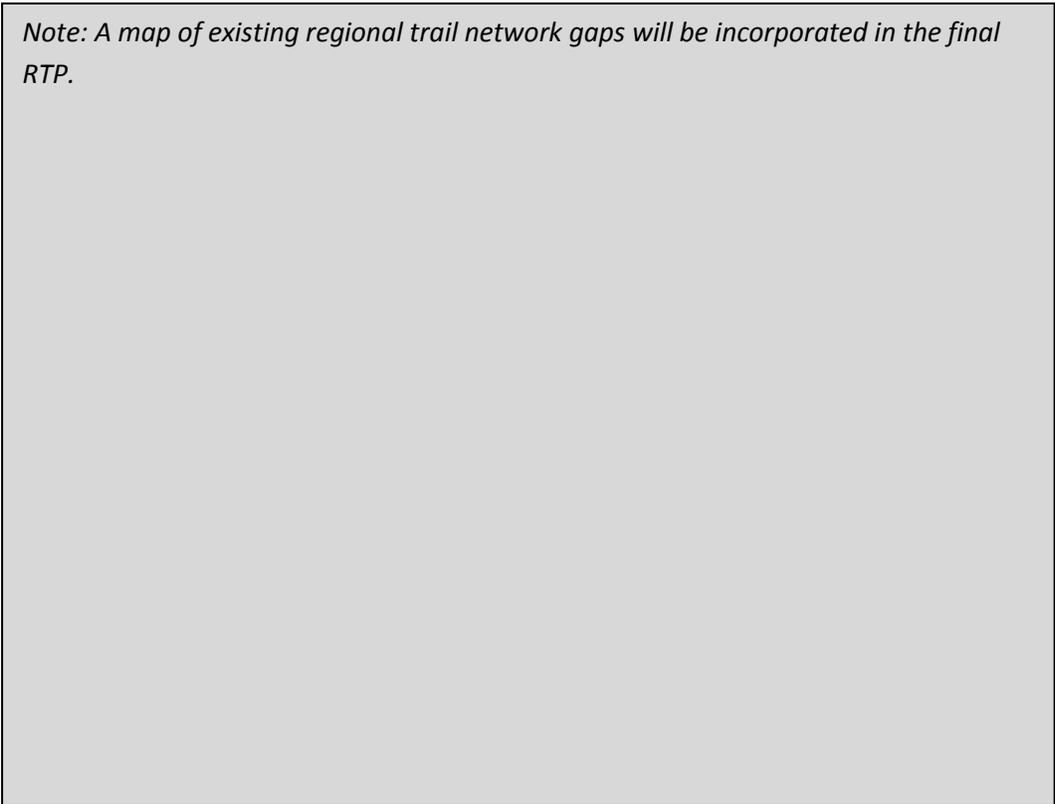

Figure 4.45 shows existing bicycle facilities in the greater Portland region in 2014. Currently, only 36 percent of all arterial roadways in the greater Portland region have bicycle facilities, and only 27 percent of all streets within 2040 centers have bicycle facilities. While demand for bicycling continues to grow the region is not taking full advantage of and supporting this affordable, reliable and healthy form of transportation.

Figure 4.47 Existing bikeways in the greater Portland region, 2014

Regional trails are a critical part of the active transportation network. Trails provide some of the most comfortable and safe facilities for walking and bicycling, especially when designed with Crime Prevention Through Environmental Design principles. Regional trails challenging to build and often require multiple partners and jurisdictions coordinating. Federal funding regulations can increase costs by up to 30 percent. Currently, approximately 36 percent of the planned regional trail network within the MPA boundary are complete.

4.7.8 Social inequity and disparities

The 2018 RTP offers opportunities to reduce barriers and disparities faced by communities of color and other historically marginalized communities.

Racial exclusion and bias leading to racial disparities

Oregon's history is rooted in racial bias, which has led to the greater Portland region having less racial diversity than other American cities. The history of Oregon's exclusionary laws dates back to 1848, when the Oregon Territory provisional government made it unlawful for Black people to live in the territory. The 1850 Donation Land Claim Act encouraged white settlers to move to the territory before any attempt was made to have the land ceded by the indigenous people – including the Multnomah, Clackamas, Tualatin and Chinook peoples of what would become the greater Portland region. In 1862, Oregon adopted a law requiring all African American, Chinese and Hawaiian people residing in Oregon to pay an additional annual tax. The Chinese Exclusion Act was passed in 1882 with the support of the state's full congressional delegation. Oregon's tensions around race continued to escalate and by the 1920s, Oregon had the nation's highest per capita membership in the Ku Klux Klan.

Through the 1940s, government policies prevented people of color from buying or renting homes outside of designated neighborhoods, while Japanese residents were relocated to internment camps during World War II. Through the 1960s and 70s – or later – real estate agents would discourage non-White clients from homes in White neighborhoods, and banks would often refuse loans for those properties when requested by a person of color. Meanwhile, banks would declare investments in homes in African American neighborhoods or other communities of color too risky and refuse loans for those properties.

Implicit and explicit practices of racial exclusion and bias extended to the development of the transportation system. People of color in Oregon had to pay additional surcharges on

Metro's strategic plan to advance racial equity, diversity and inclusion

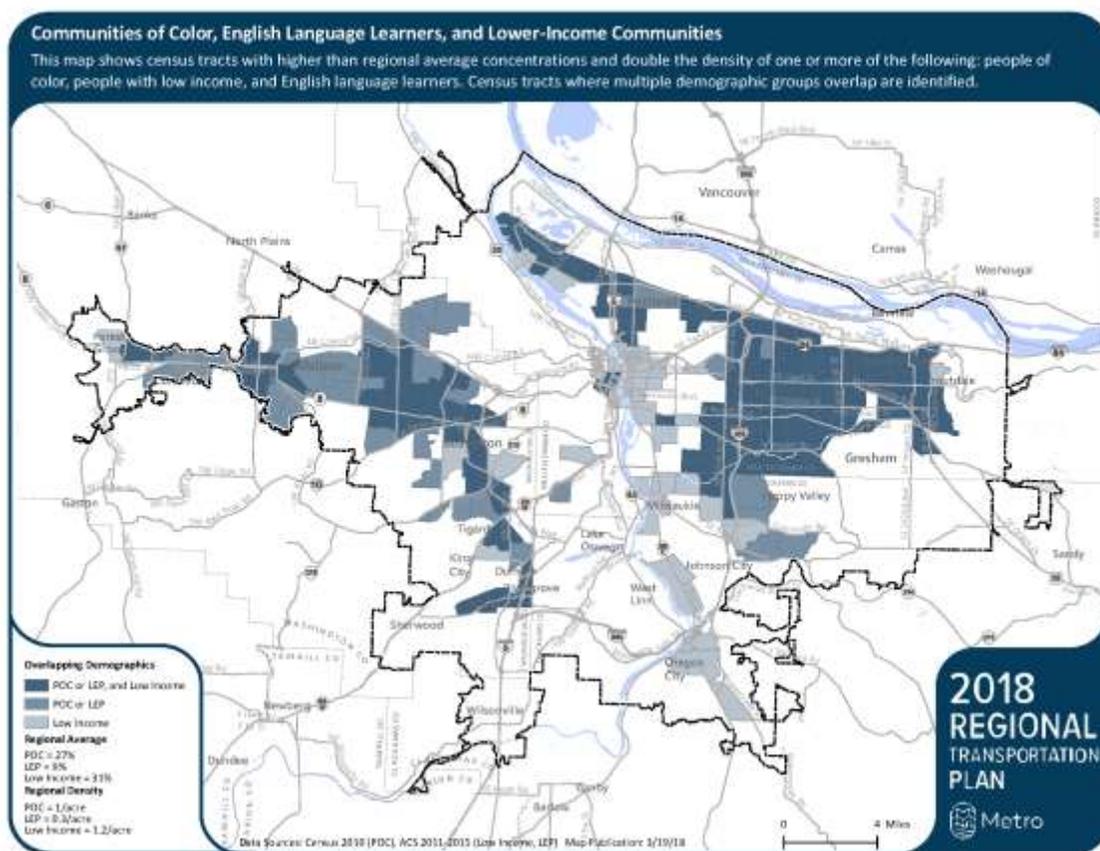

In June 2016 with the support of MPAC, the Metro Council adopted an equity plan that leads with race, committing to concentrate on eliminating the disparities that people of color experience, especially in those areas related to Metro's policies, programs, services and destinations. People of color share similar barriers with other historically marginalized groups such as people with lower income, people with disabilities, LGBTQ communities, women, older adults and young people. But people of color tend to experience those barriers more deeply due to the pervasive and systemic nature of racism.

By addressing the barriers experienced by people of color, we will also effectively identify solutions and remove barriers for other disadvantaged groups. The result of this racial equity focus will be that all people in the 24 cities and three counties of the greater Portland region will experience better outcomes.

car insurance up until 1951. When Interstate 5 opened in the 1960s, the new freeway cut a swath through Portland’s established African American neighborhoods, destroying at least 50 square blocks of homes and creating a barrier that still exists today.

Today, communities of color continue to point to issues of racial bias and inequity in enforcement of traffic laws and transit fares. Studies have also shown that drivers in the greater Portland region are significantly less likely to stop to allow an African American pedestrian to safely cross the street. Additionally, people of color are more likely to be victims of traffic fatalities and severe injuries.

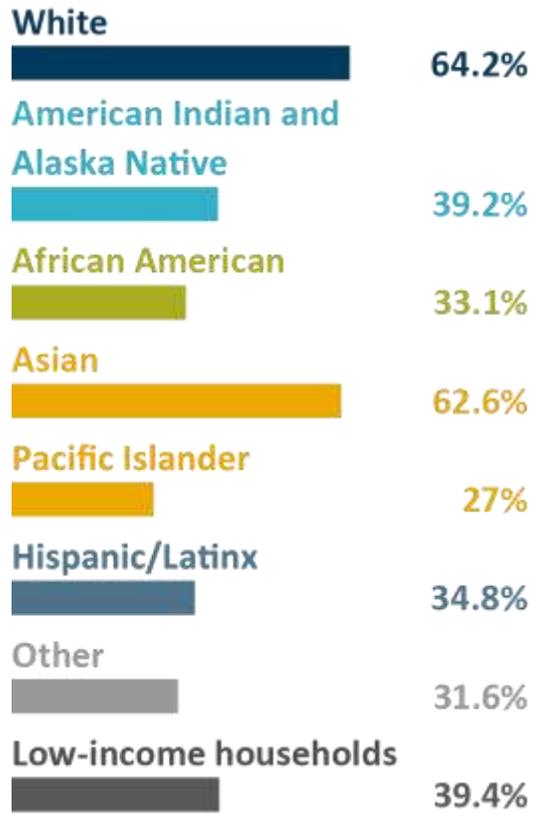

Figure 4.49 Map of communities of color, English language learners and lower-income communities in the greater Portland region, 2010

4.7.9 Housing and transportation affordability and displacement

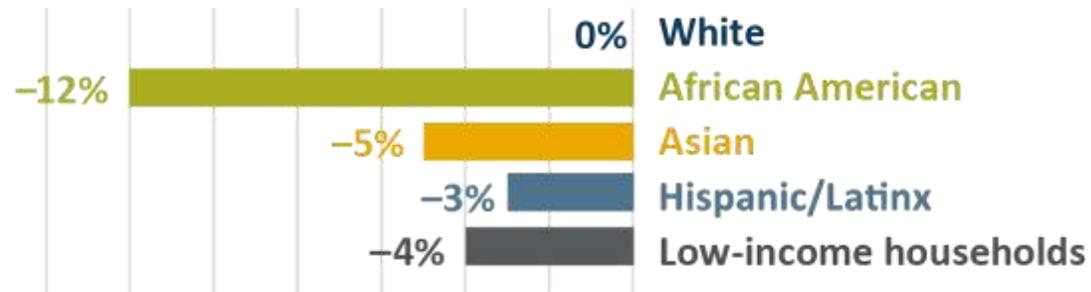

Homeownership is cited as a key tool in both personal and family wealth development and community stabilization. Not only do people of color face issues of inequity in access to education and pay, the legacy of systemic racism in the region is reflected in current homeownership rates, which differ greatly by race.

Figure 4.50

As housing costs increase, families who own homes benefit from increased home value, while people who rent are forced to move farther from job centers and the community resources they rely on, increasing their daily travel cost and time.

Figure 4.51 Change in proximity to jobs within typical commute distance by race and ethnicity, 2002-2012 Portland-Vancouver MSA

Note: original source did not provide information for American Indians or Pacific Islanders

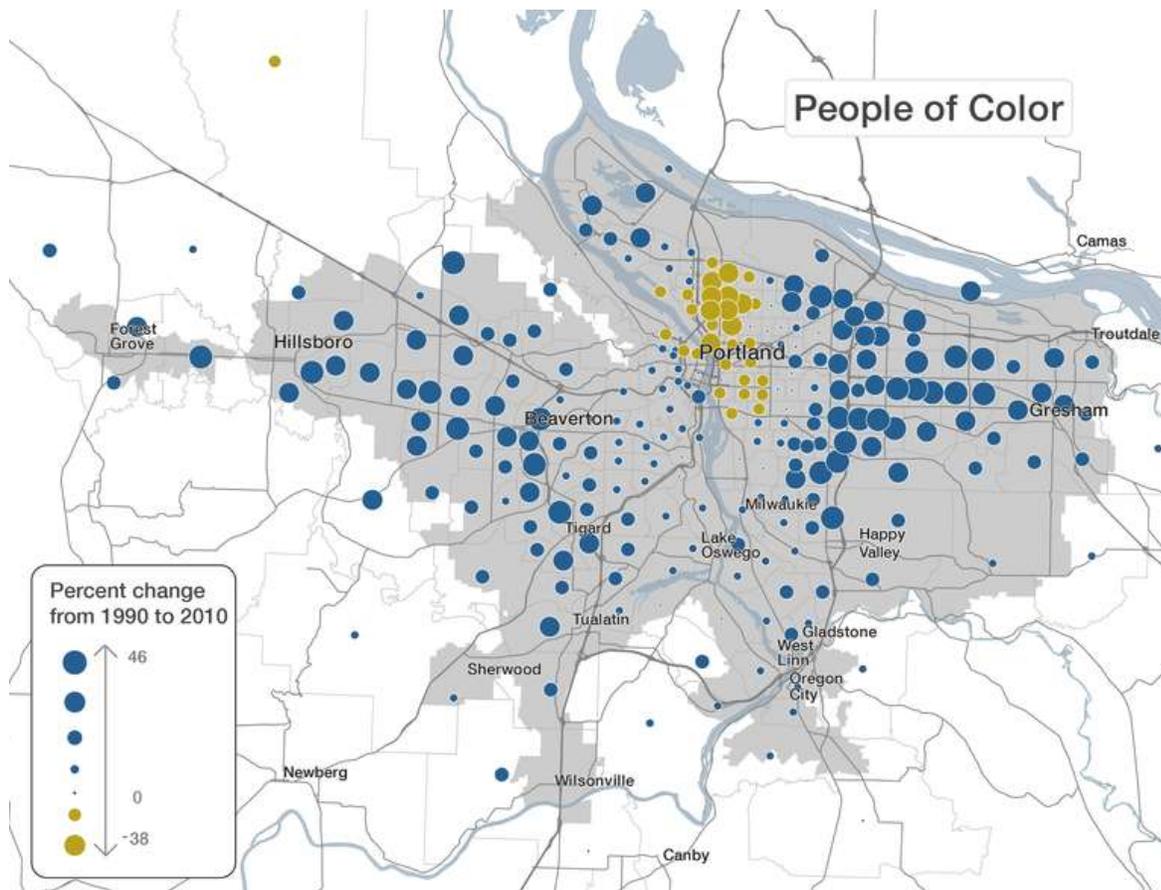

For example, a study by the Brookings Institute found that between 2000 through 2012, the number of jobs in a typical commute distance – for the greater Portland region that is 7.1 miles – fell by 1 percent, but for African Americans, Asians, and Latinx the number of jobs fell by 12 percent, 5 percent, and 3 percent during that 12-year period. Whereas for

White residents, the number of jobs within a typical commute distance did not change over the past 12 years – as shown in **Figure 4.49**.

Displacement affects communities as much as individuals

Displacement is often seen simply as a consequence of a growing population and an improving economy. Often unrecognized is a history that has concentrated communities of color into specific areas where they built strong community ties. Since these individuals and communities continue to face systemic inequities that limit access to the benefits of an improving economy, they are often priced out of these same areas as others gain stronger purchasing power. Not only does this displacement increase travel time and cost for individuals, it can create a cascading effect on the viability of community resources such as places of worship, community centers and culturally-focused businesses as members, users and customers lose convenient access.

Figure 4.52 Displacement for people of color in the greater Portland region, 1990-2010

4.7.10 Technological change

Technology is already transforming the greater Portland region's transportation system. In the City of Portland, ride-hailing services now carry more people than taxis do, providing over ten million rides within the city in 2017. Car share companies including Car2go, ReachNow and Zipcar operate over 1,000 vehicles in the greater Portland region. Some of these companies have been around for a decade, but new models have sprung up, including free-floating car share, which allows people to pick up and drop off a car anywhere within a defined area, and peer-to-peer car share, which makes it easy for neighbors to borrow cars from each other. The City of Portland's bike share system, Biketown, launched in July 2016 and carried over 300,000 trips in its first year, and there are signs that other bike share companies are looking to launch service here soon.

Meanwhile, smartphone apps have become the most popular way for people to get information on their travel choices, while the number of people who get information from other sources declined swiftly over the past three years. People increasingly rely on the real-time information that apps provide to make on-the-go decisions when congestion or a change in circumstances means that they can't take the mode or route that they normally do.

New services like car sharing and ride-hailing are bringing more affordable and efficient options to the region, but some of them may also be competing with transit and increasing congestion. We have new ways to meet the transportation needs of underserved people, but many of these new options are not accessible to all. Surveys conducted by Metro find that a disproportionately large number of frequent ride-hailing users are wealthy and young, while a disproportionately small number are low-income people or people over 45. The impacts are mixed and our information is limited, but it's clear that we're in an era of rapid change, and that public agencies need to act to make sure that emerging technology helps create more equitable and livable communities across the greater Portland region.

Many companies are already testing automated vehicles, and we will likely see these vehicles on the streets of our region within the next five years. Autonomous vehicles will likely accelerate the already-growing use of new mobility services when they arrive. New mobility companies are poised to be first to deploy shared autonomous vehicles, which could enable them to cut the cost of trips and serve new users.

These developments will deepen the impacts that technology is already having and affect how some of the most pressing issues facing our region play out. The greater Portland region has inequitable access to safe, reliable, healthy and affordable ways to get around and is experiencing rapid population growth, rising housing costs and increasing congestion. Emerging technology has the potential to help us confront these challenges – transportation equity, congestion, advancing the public interest - or to exacerbate them.
